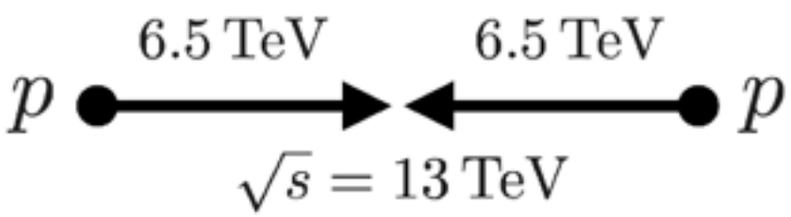
Searches for BSM physics in final states with jets and leptons+jets at CMS

Francesco Santanastasio

"Sapienza" University of Rome and INFN

5th International Conference on New Frontiers in Physics
ICNFP2016, 06-14 July 2016, Kolymbari (Crete)

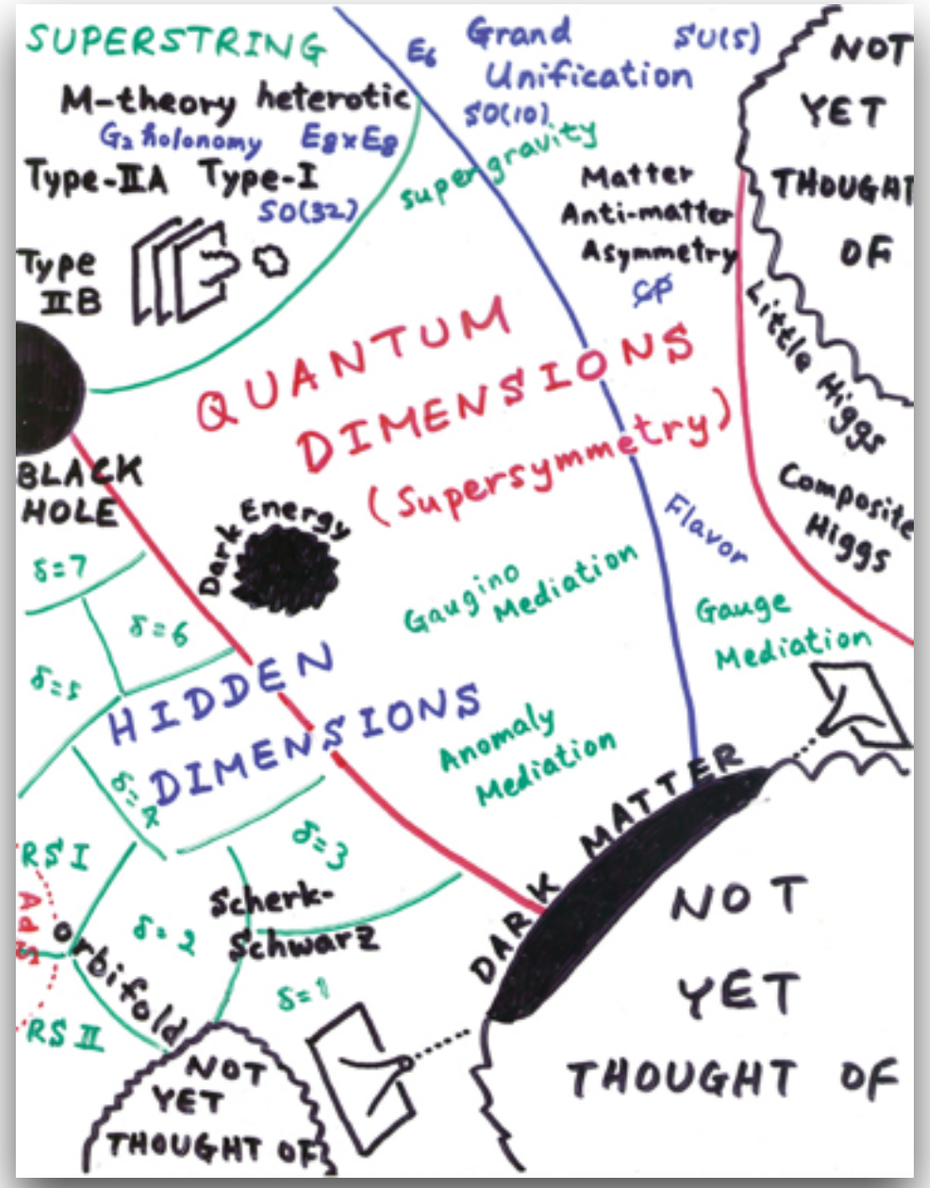
Large Hadron Collider (LHC)



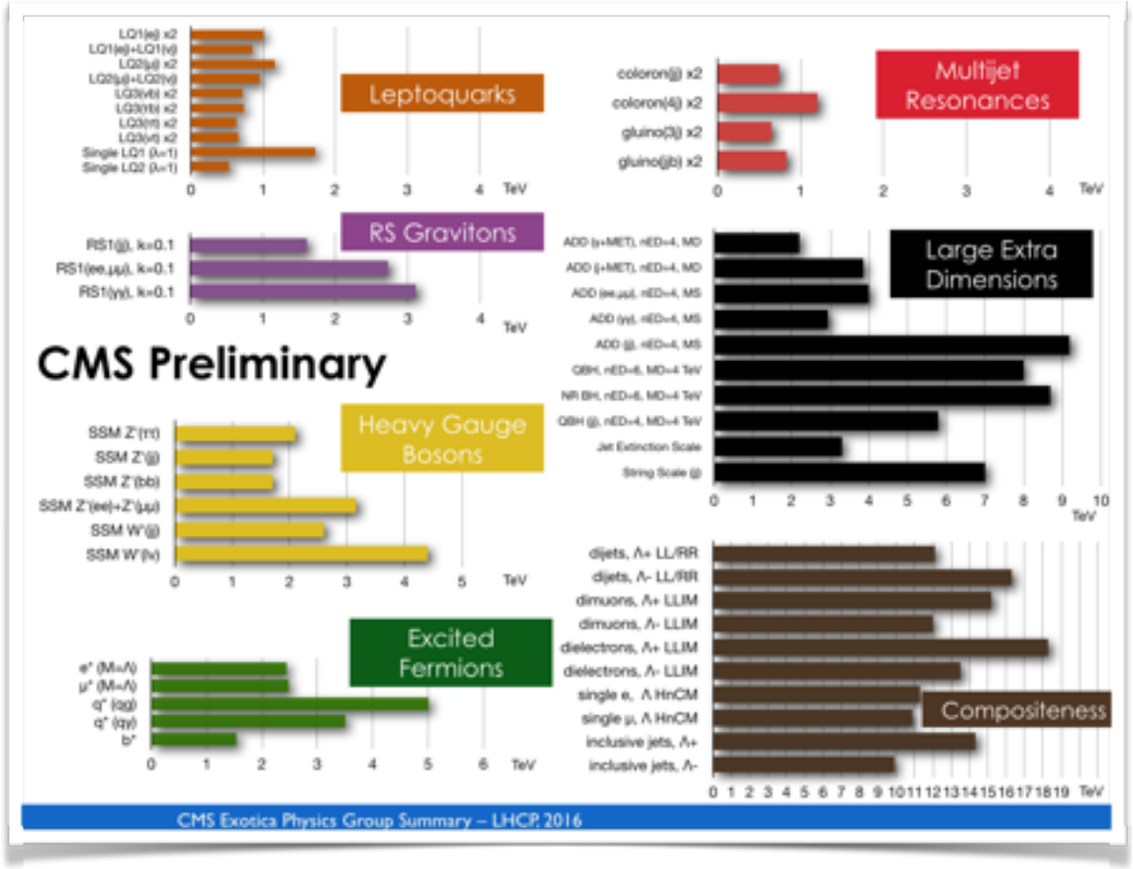
- Still many unanswered questions in Standard Model (SM)
  - what is dark matter? where is all the antimatter in the universe? why gravity is so weak? etc..
- **LHC is the ideal place to find new physics beyond SM at the TeV scale**

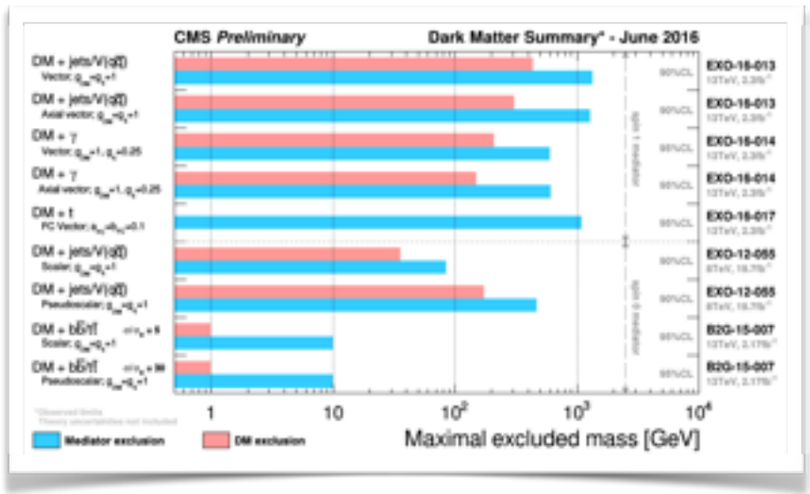
Physics beyond SM

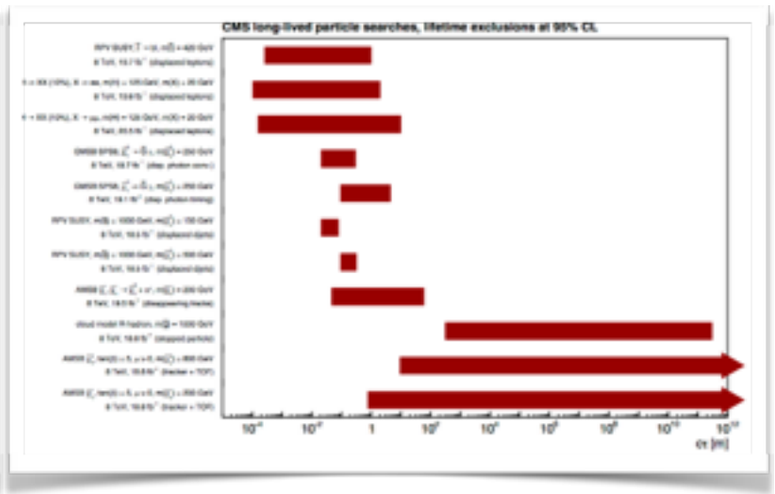
Many theory predictions



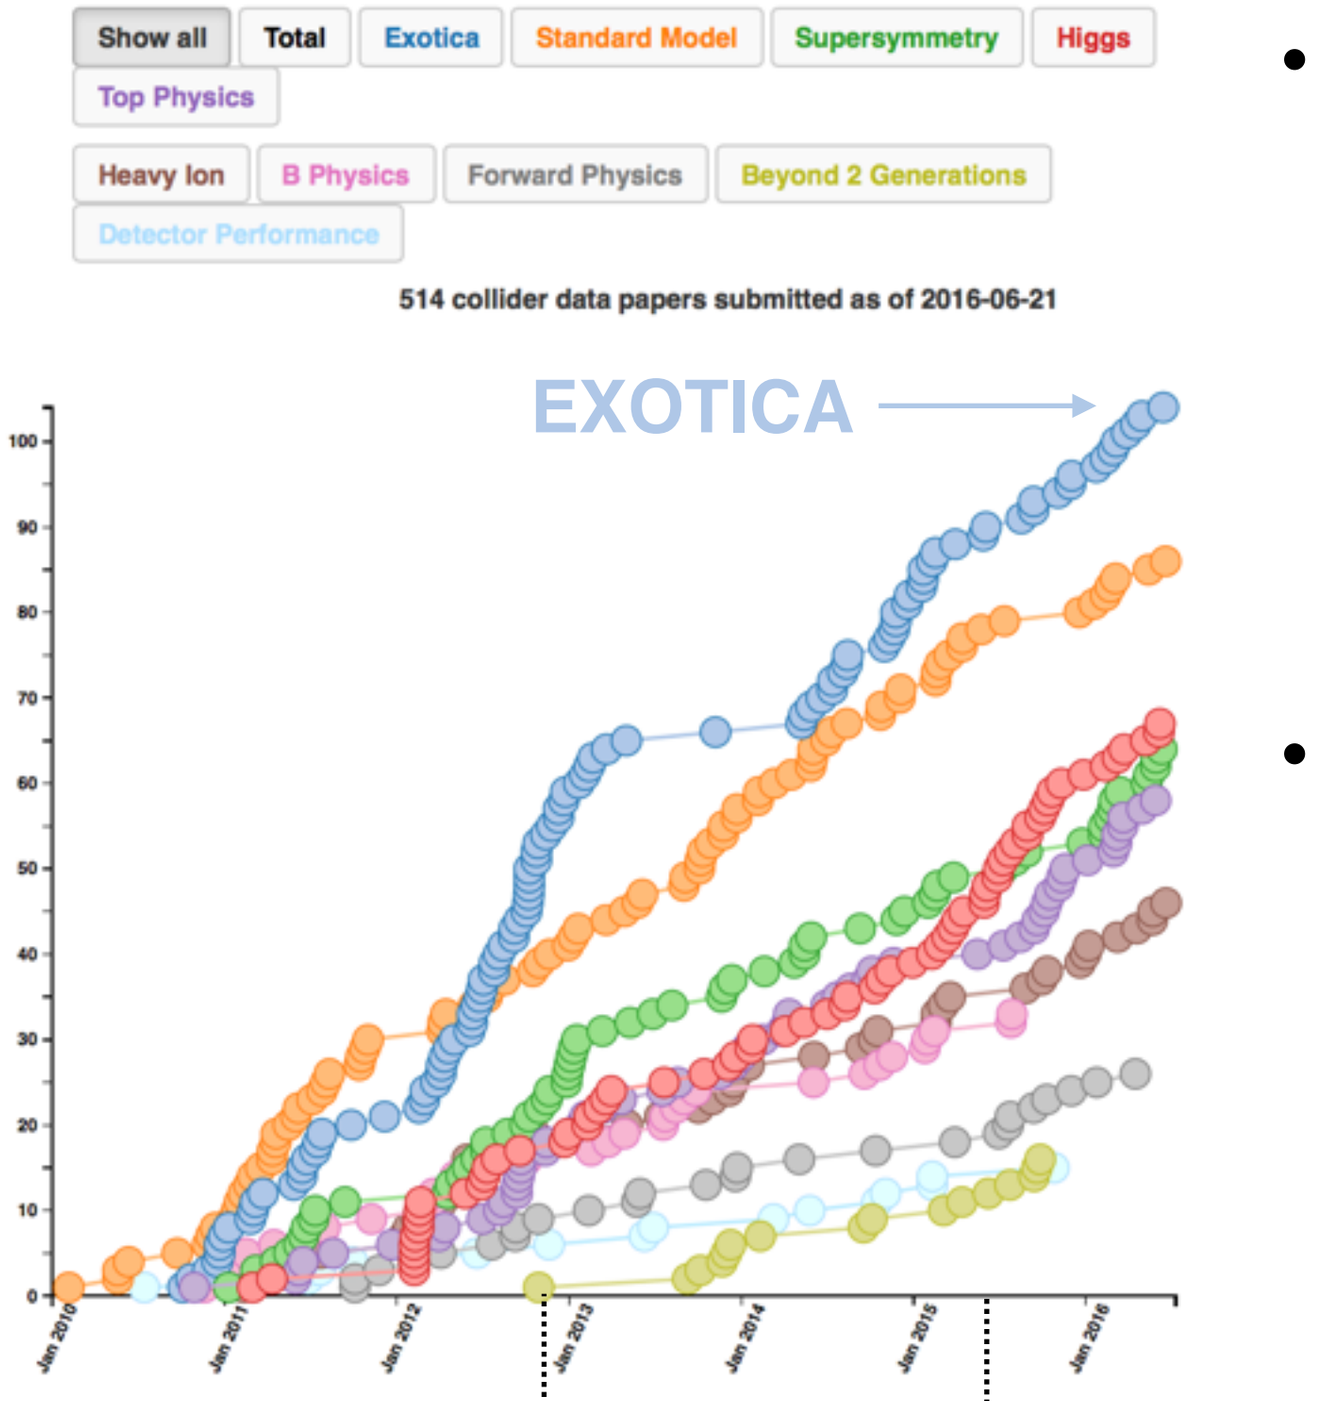
Many searches in CMS







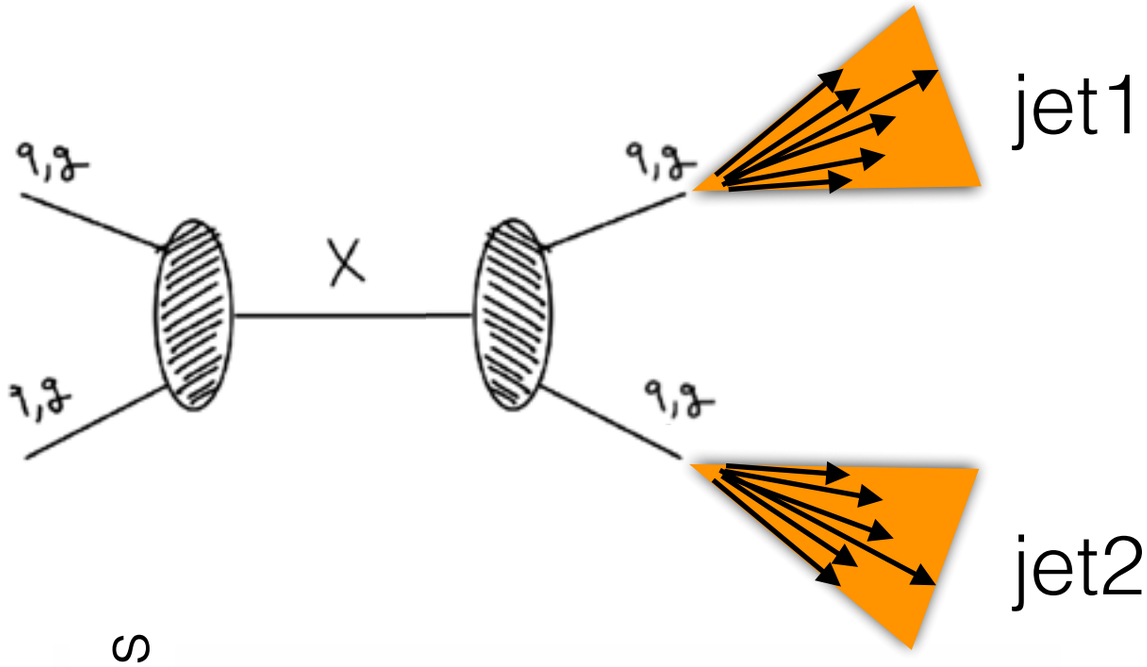
CMS publications

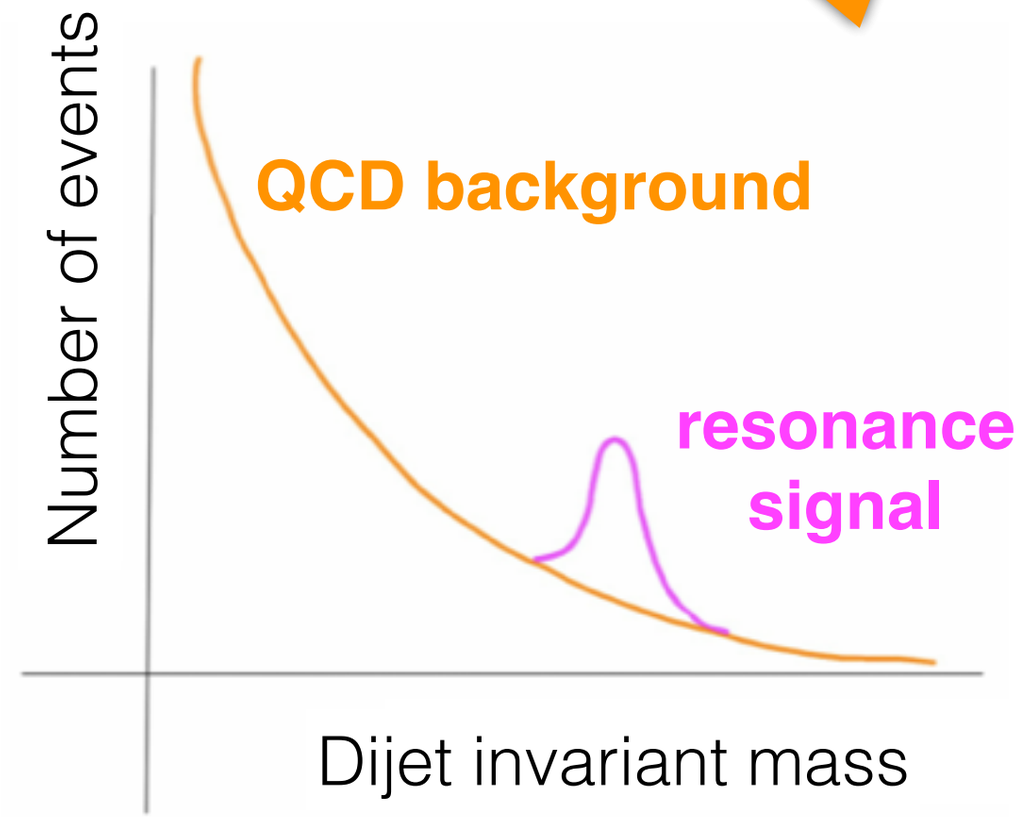


- Searches for new physics produce the largest number of publications in CMS
  - ~100 from Exotica
  - ~65 from Supersymmetry
  - ~15 from B2G
- In this talk, focus on some Exotica signatures of **new physics in jets and leptons +jets final state**
  - selection of few recent results

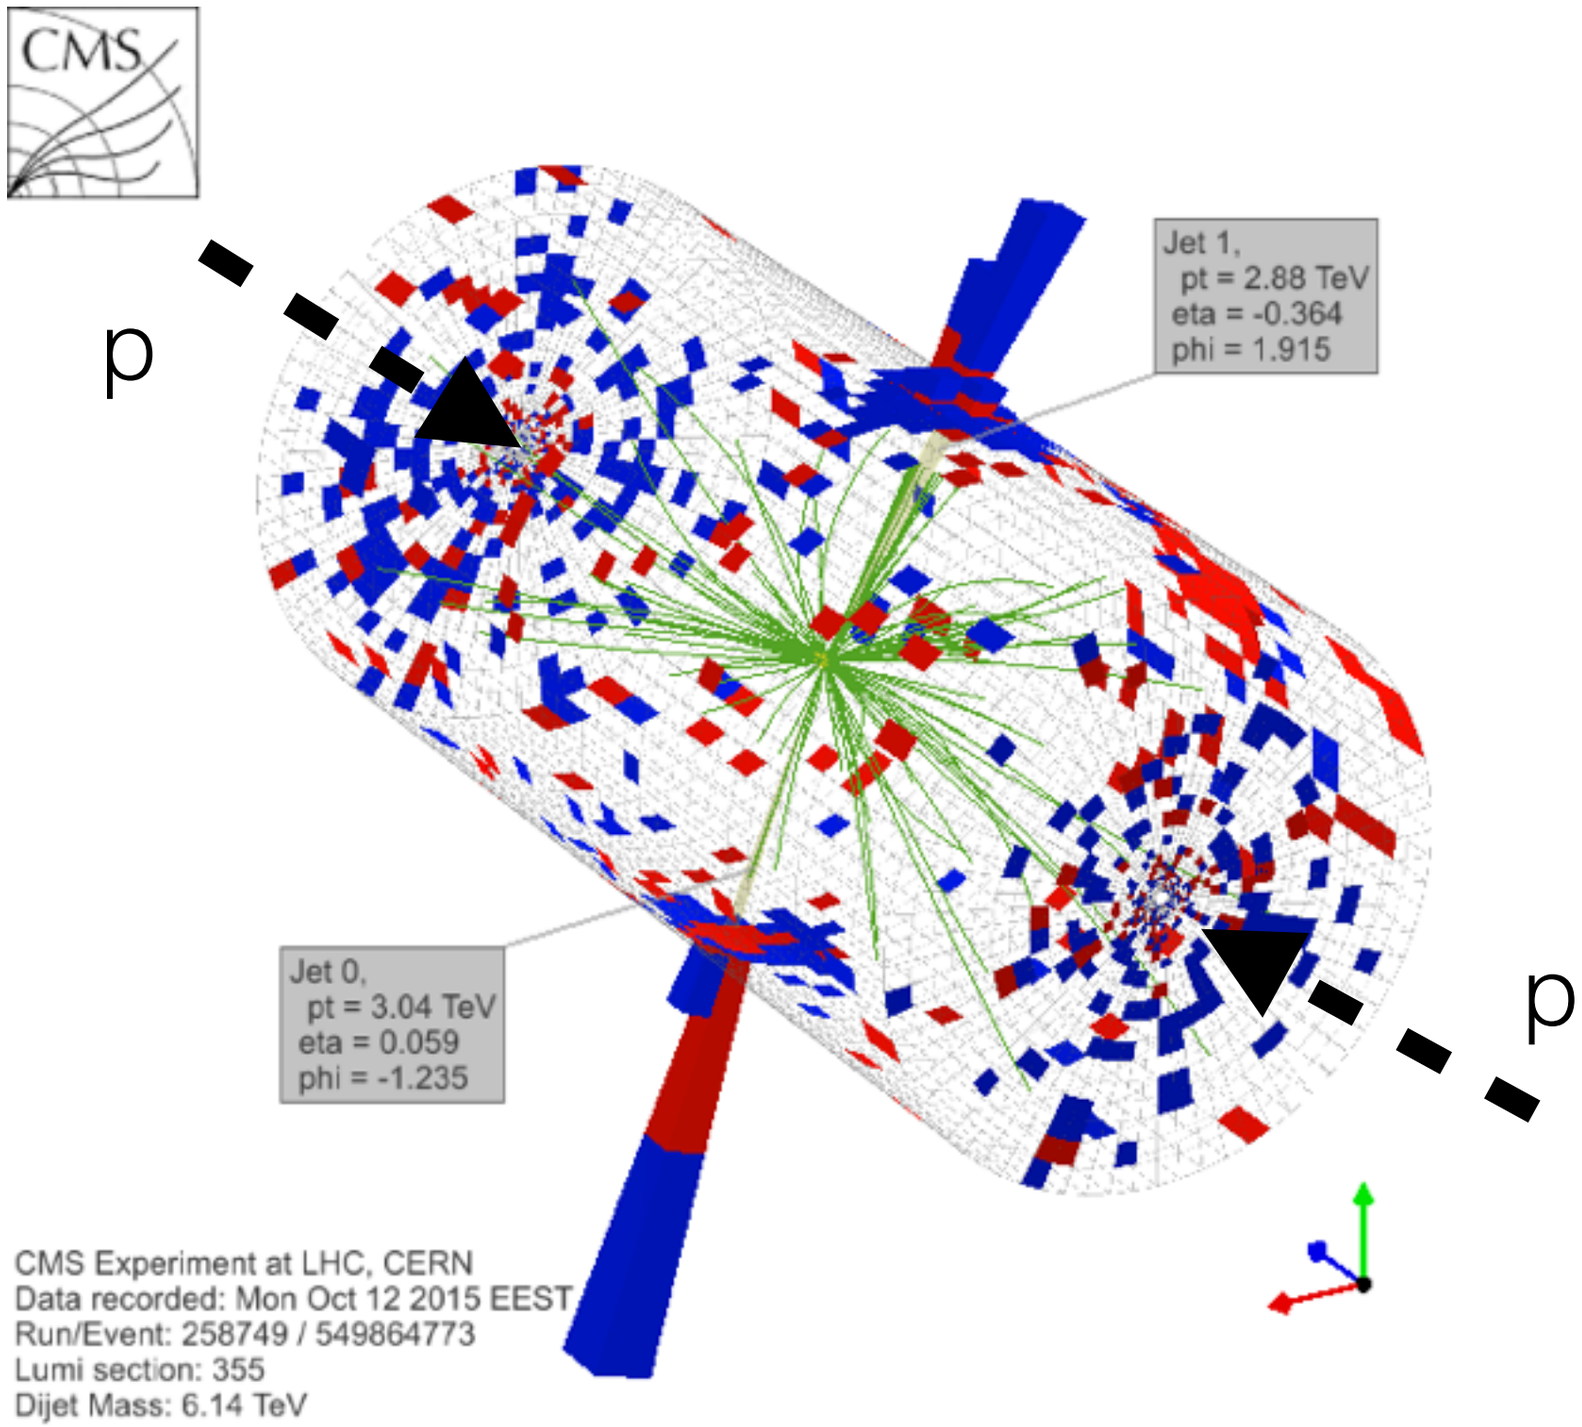
Dijet resonances

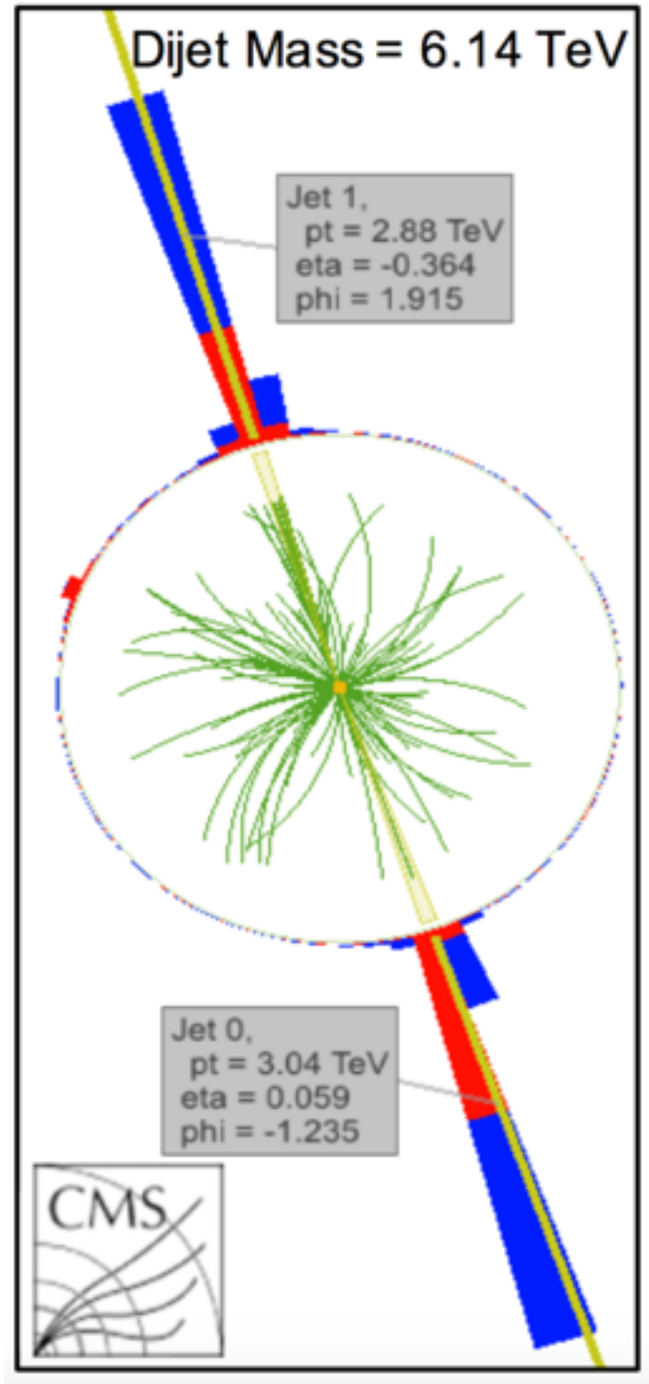
- Nearly any new resonance that might be seen at LHC should couple to quarks/gluons
  - **dijet final state**
- Search strategy
  - look of narrow bump in dijet invariant mass spectrum
- High-mass search using standard data stream (mass > 1 TeV)
- Low-mass search using special data stream (mass < 1 TeV)





Highest dijet mass event (~6 TeV)



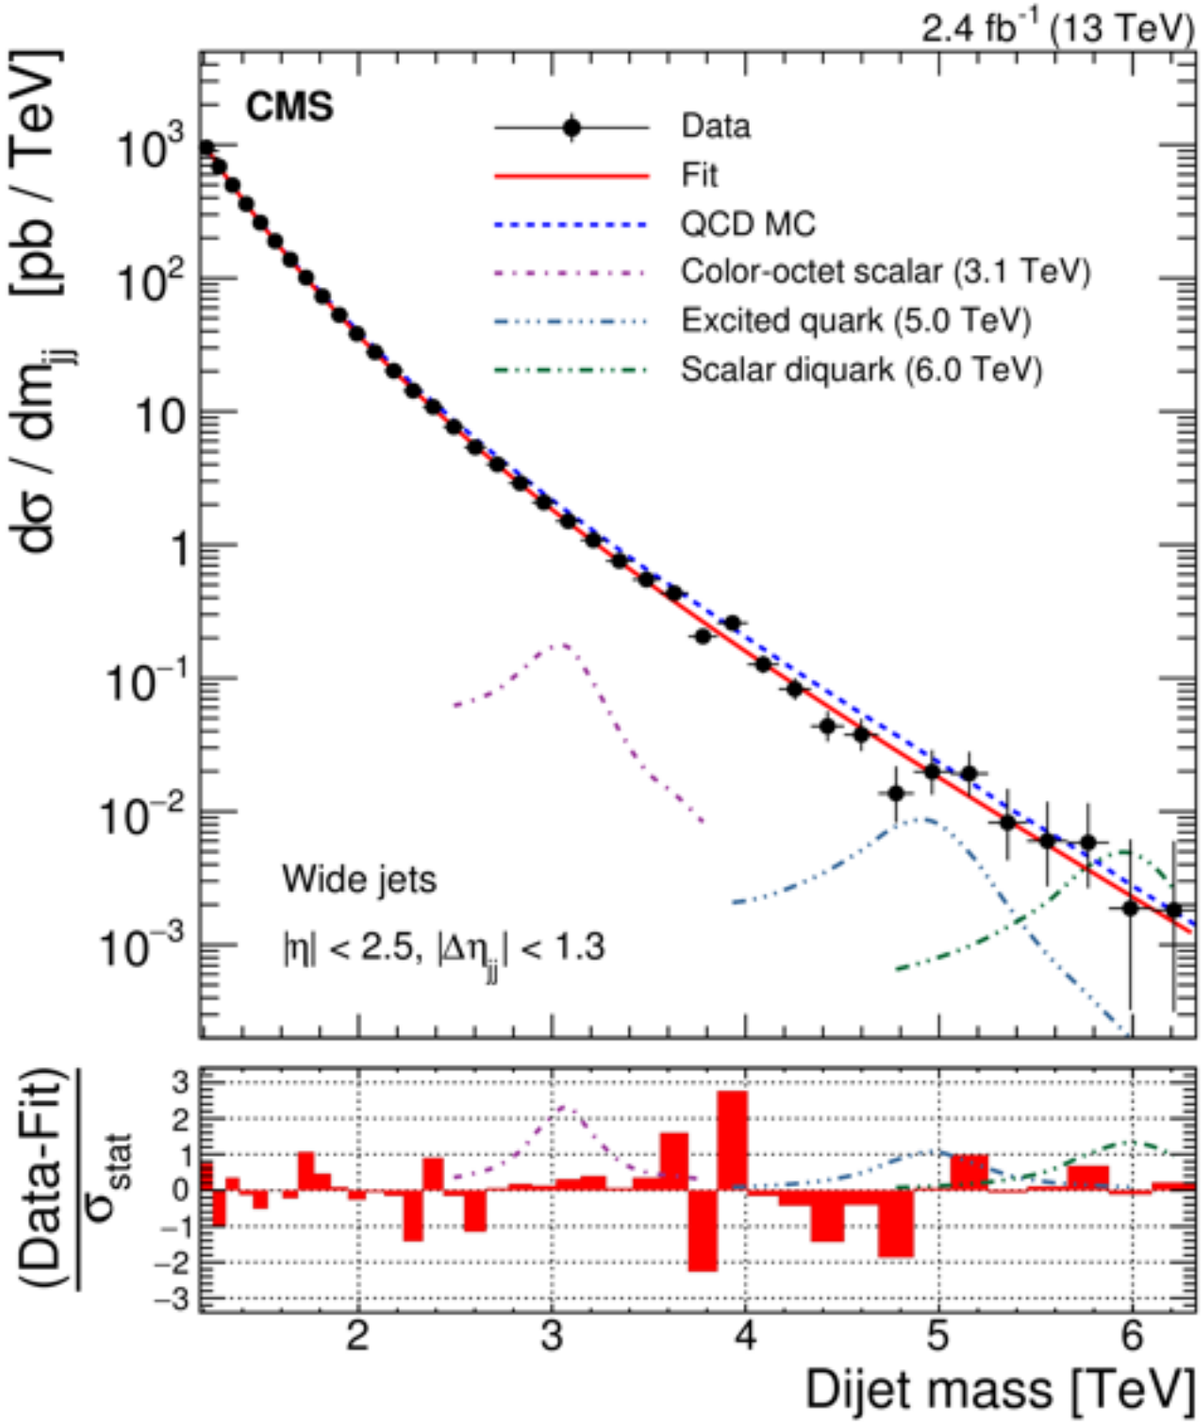


High-mass dijet search

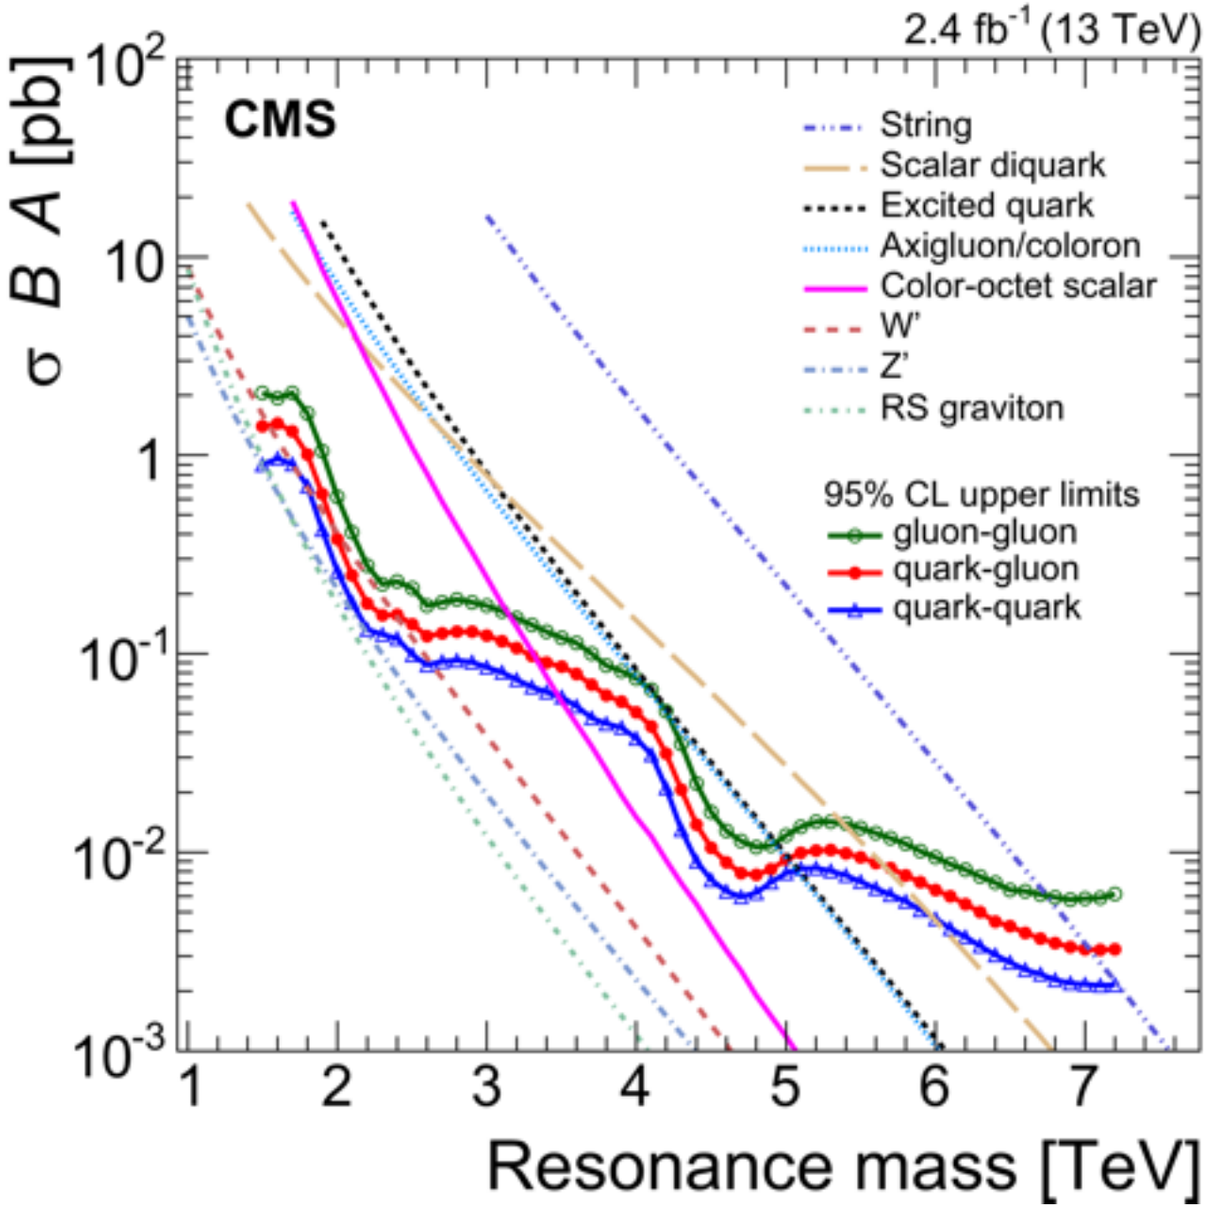
- Trigger selection
  - $H_T = \sum_{jets} p_T^i > 800\text{GeV}$
- Wide jets (R=1.1) used to recover final state radiation
  - improve energy scale and resolution
- Fit data with smoothly falling background function
  - same parameterization successfully used in previous searches

$$\frac{d\sigma}{dm_{jj}} = \frac{p_0(1-x)^{p_1}}{x^{p_2+p_3\ln(x)}} \qquad x = \frac{m_{jj}}{13000}$$

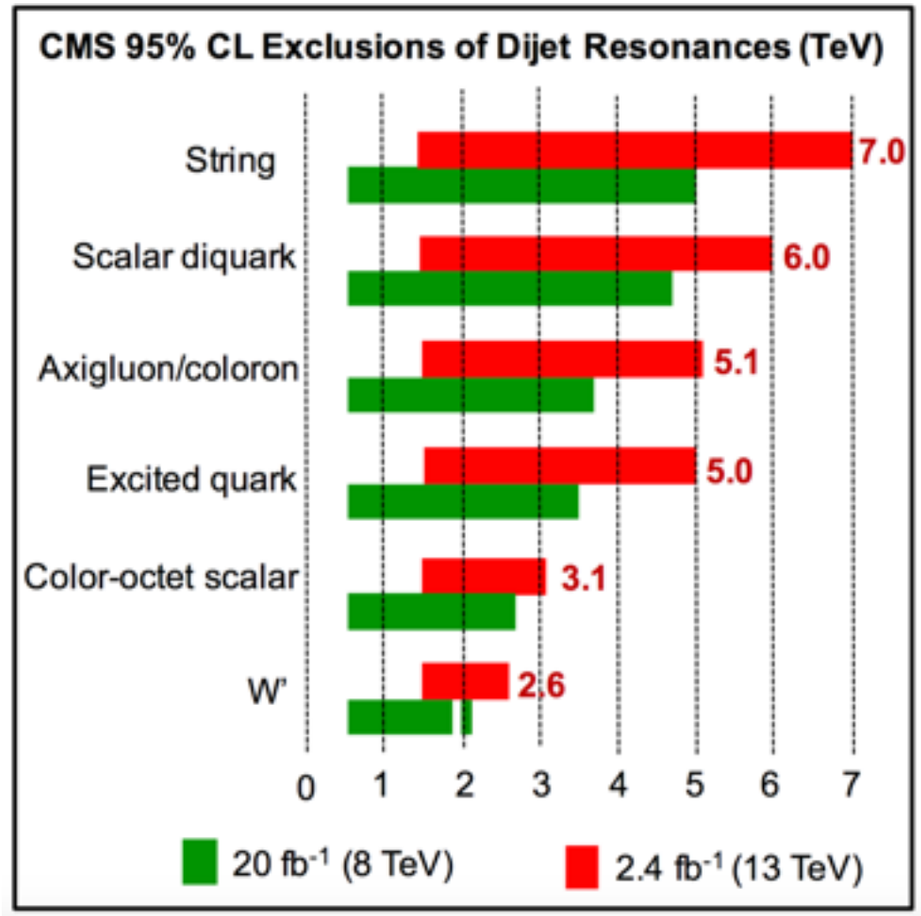
- **No new resonance observed**, set limits



High-mass limits at 13 TeV



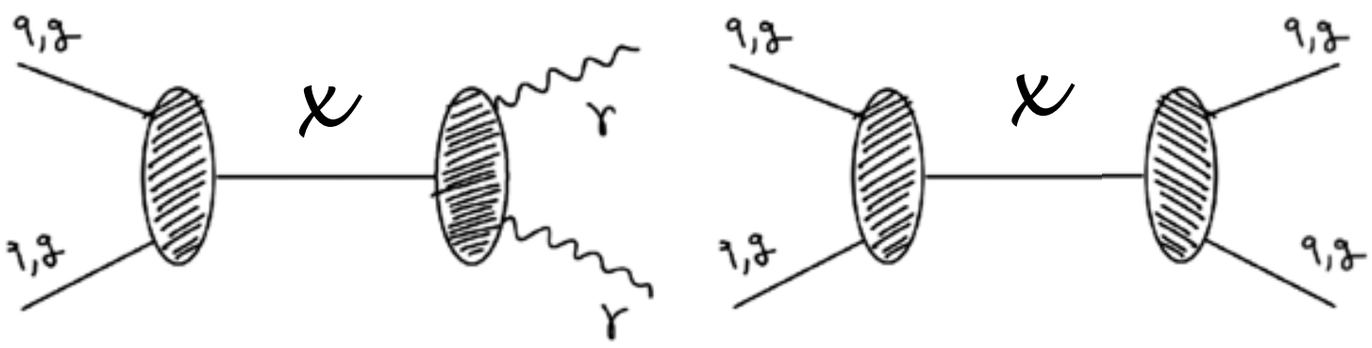
Phys. Rev. Lett. 116 (2016) 071801 [1]

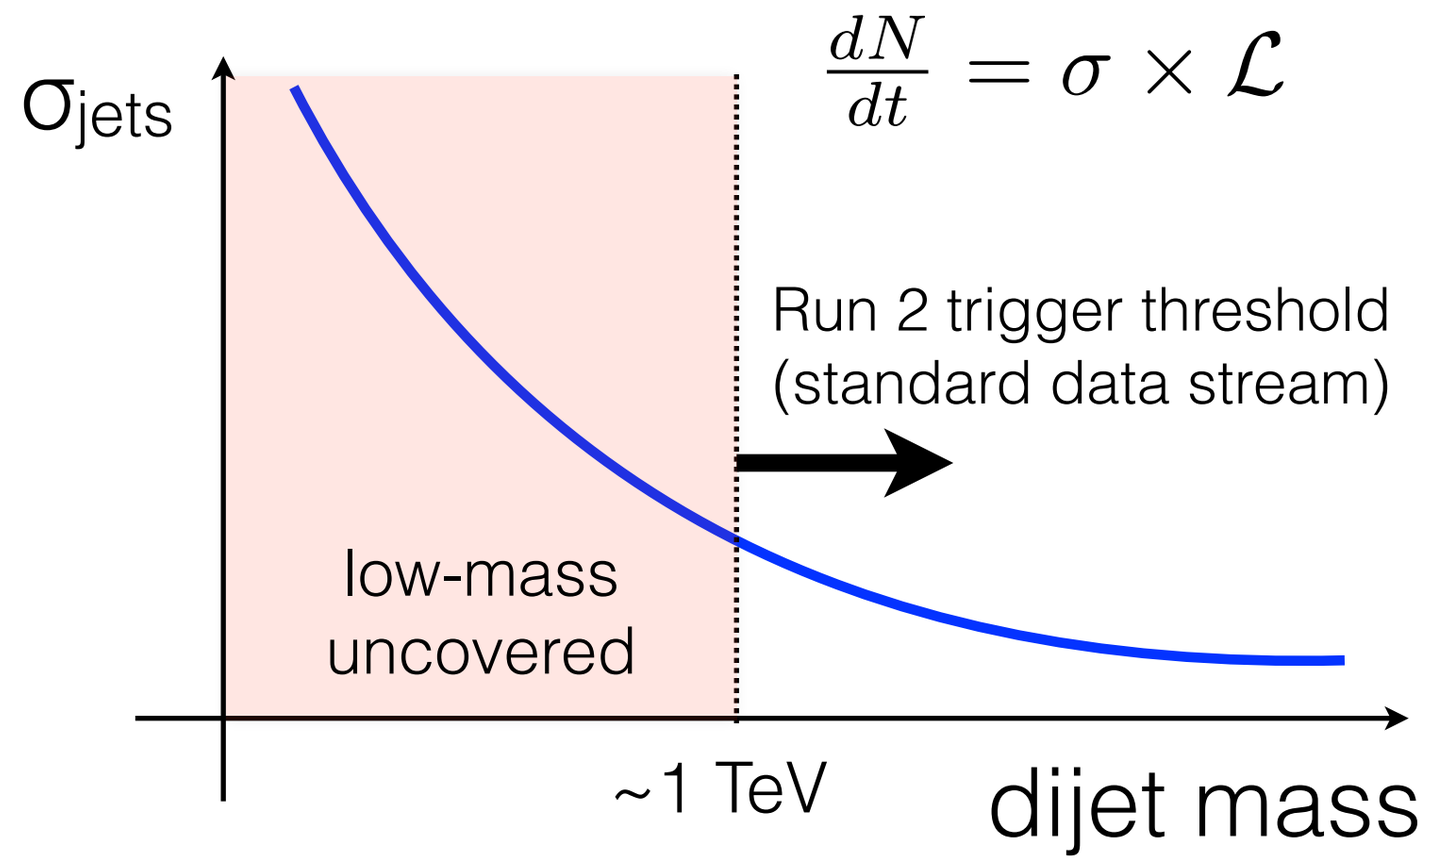


- Different final states considered: **qq**, **qg**, **gg** resonances
- **More sensitive than Run1** for resonance masses >2 TeV

Low-mass dijet search

- **Important to cover the full mass range in BSM searches**
- Hot topic
  - diphoton excess at 750 GeV [2]
  - decays to jets are expected
- Experimental difficulties
  - large dijet cross section at hadron colliders at low-mass
  - limited resources to process and store data
  - trigger thresholds raise with increasing inst. luminosity($\mathcal{L}$)

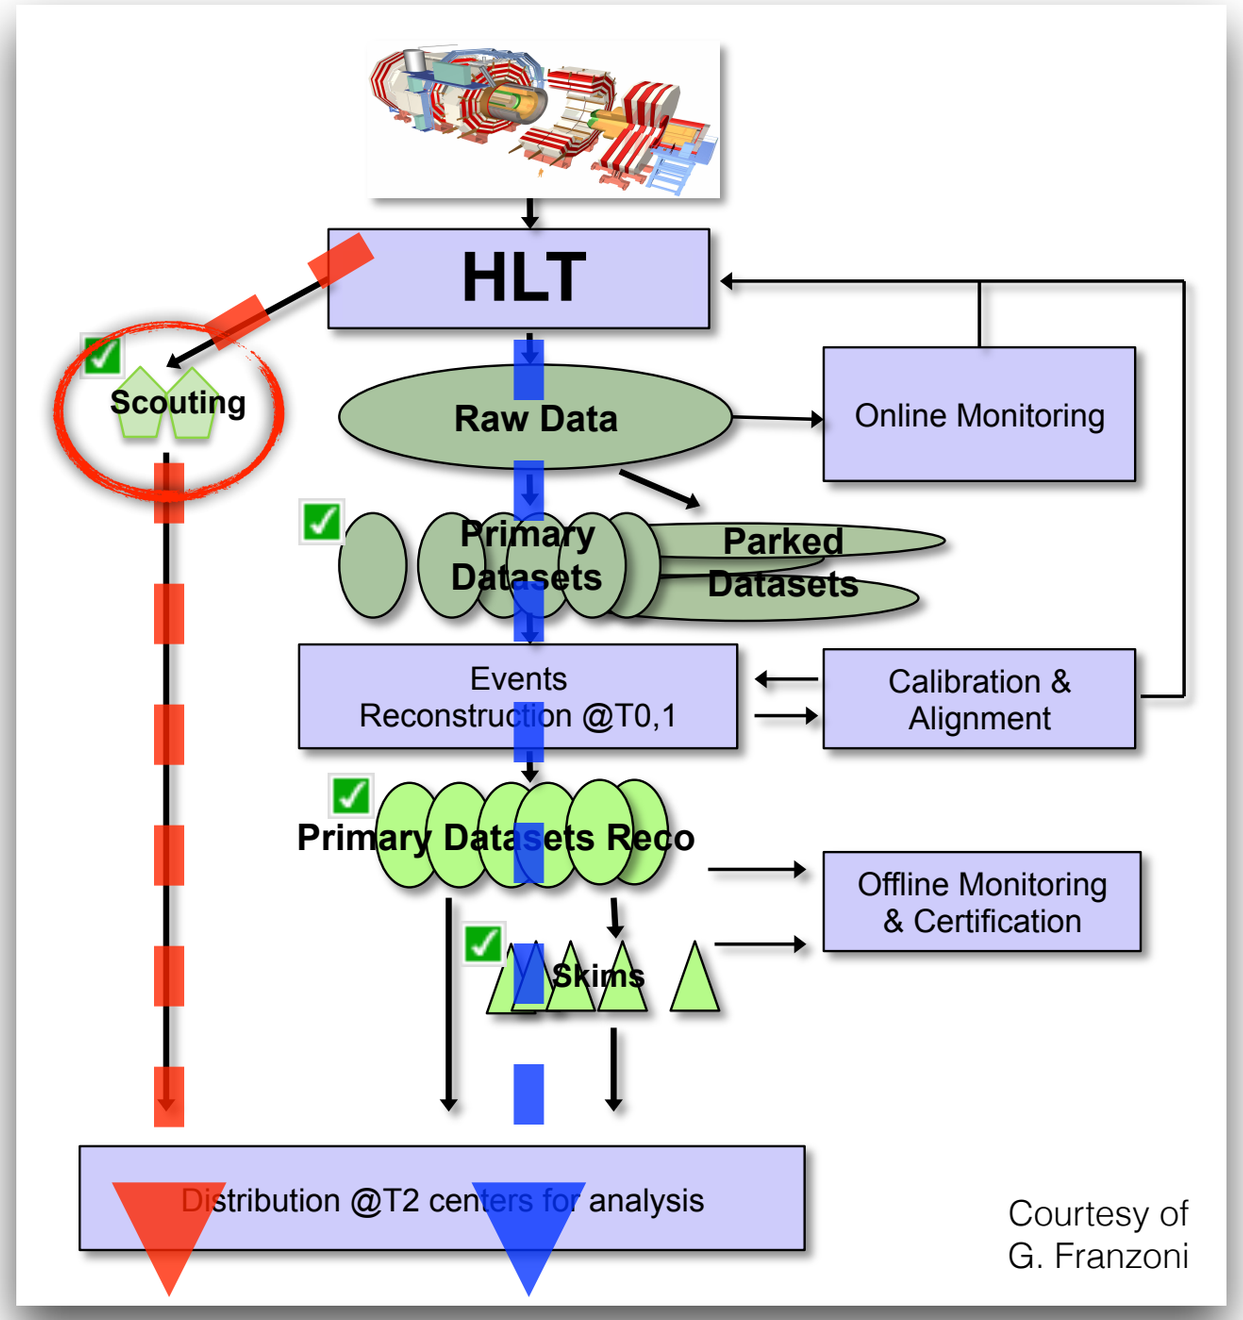




“Data scouting” in CMS

First introduced by CMS in 2011 [3,4]

Physics Goal: recover sensitivity to new physics in phase space not accessible via the **standard trigger selection**



Courtesy of G. Franzoni

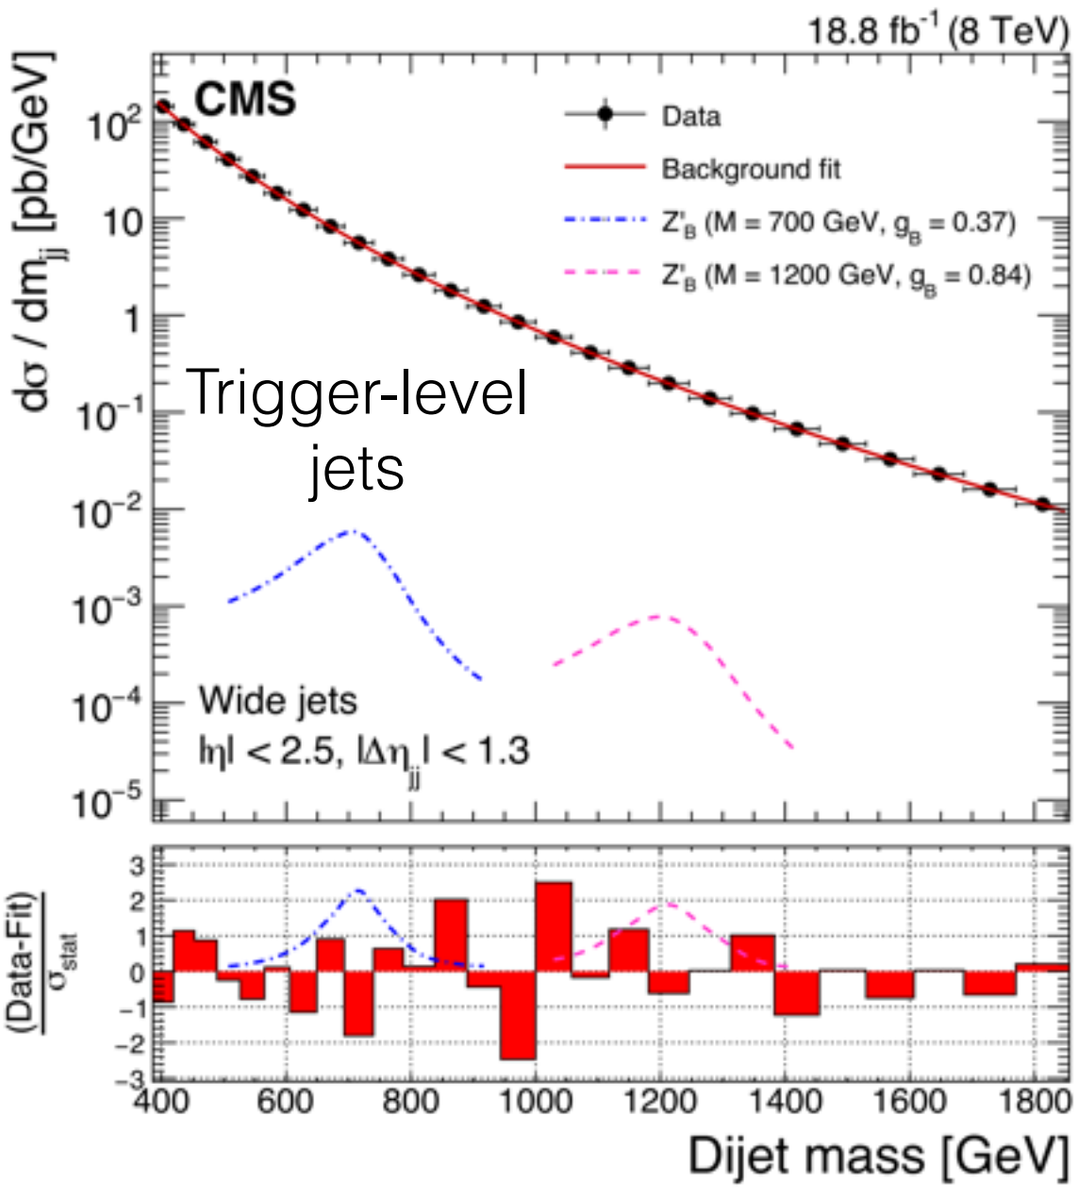
	Main data stream	Data scouting
Trigger selection	**All CMS triggers ex. for dijet** $H_T > 800\text{GeV}$	**Low-pT jet triggers** $H_T > 250\text{GeV}$
Event rate	**~1 KHz**	**~4 KHz**
Event content	**FULL (RAW data + offline reconstruction)**	**REDUCED (store calo jets reconstructed at trigger level)**
Bandwidth	**~1 GB/s**	**~0.01 GB/s**

1 calo scouting event $\sim$ 3KB $\sim \frac{1}{10}$

cmslogo.gif

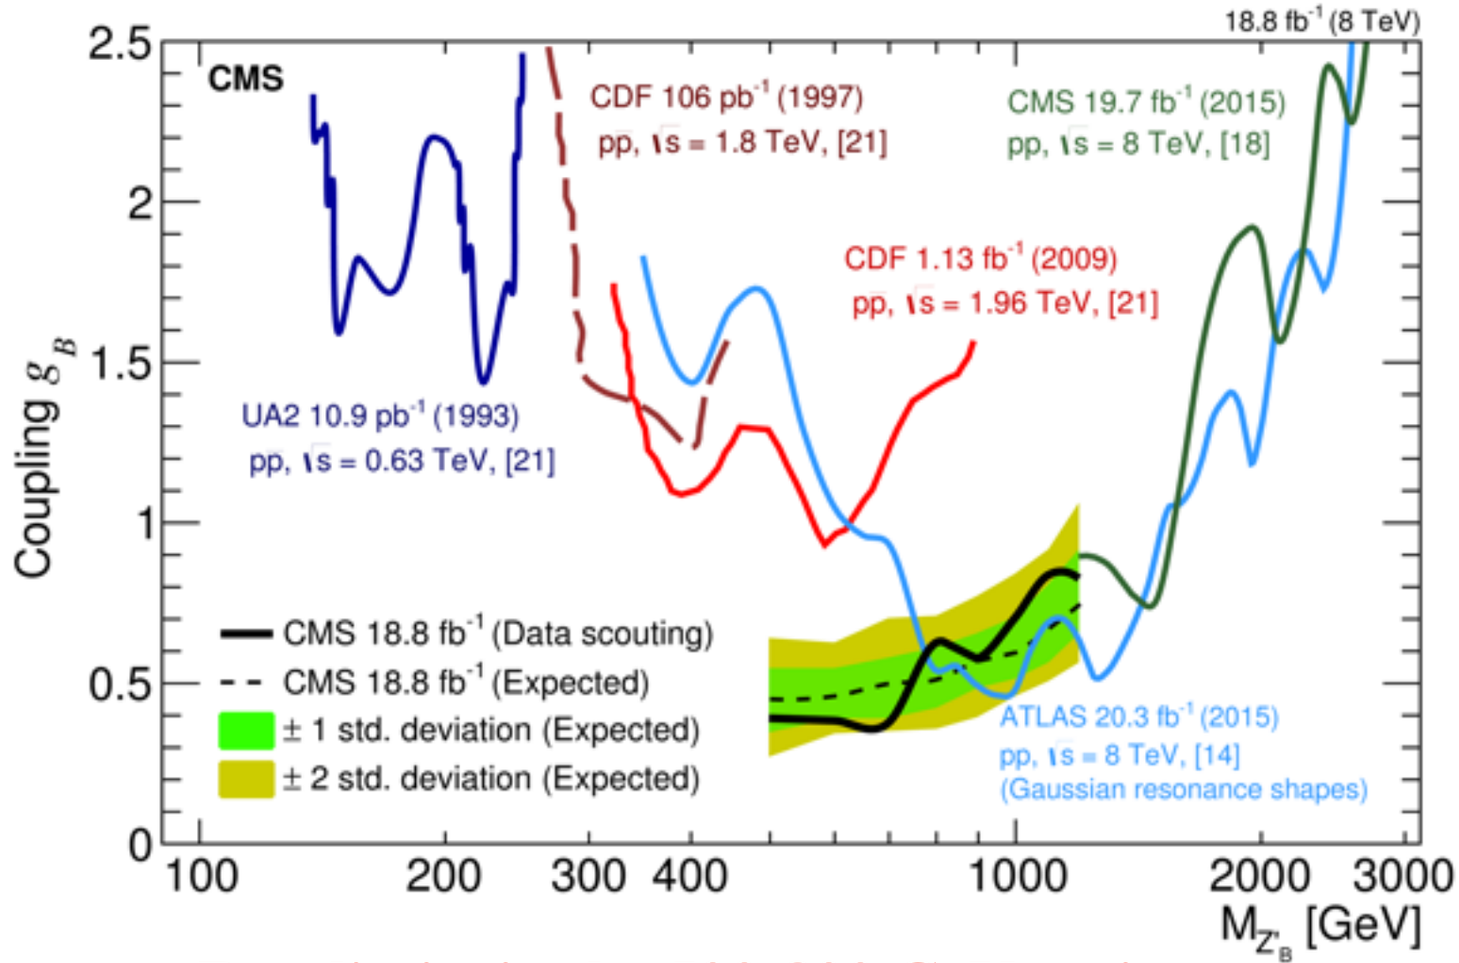
Low-mass limits at 8 TeV

https://arxiv.org/abs/1604.08907, Accepted by PRL [5]



- No excess at 750 GeV

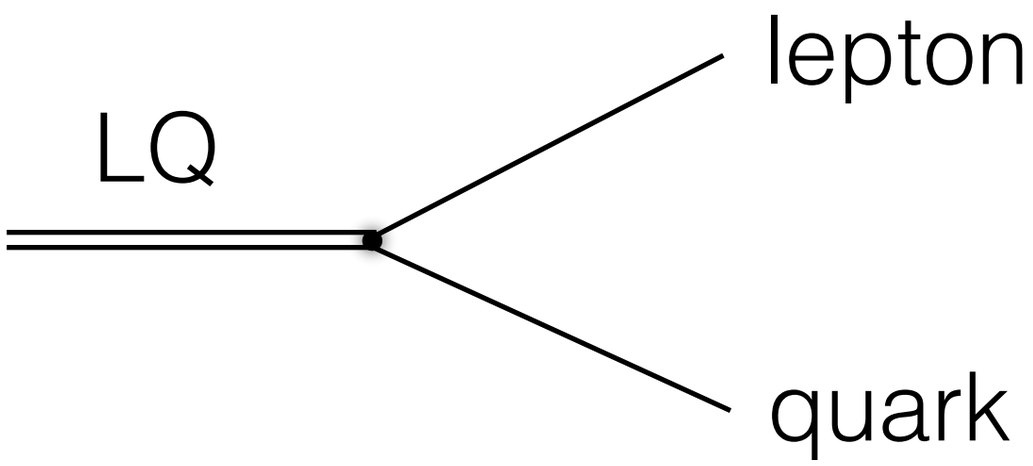
Leptophobic Z'->qq model $\frac{g_B}{6} Z'_{B\mu}\,\bar{q}\gamma^{\mu}q$

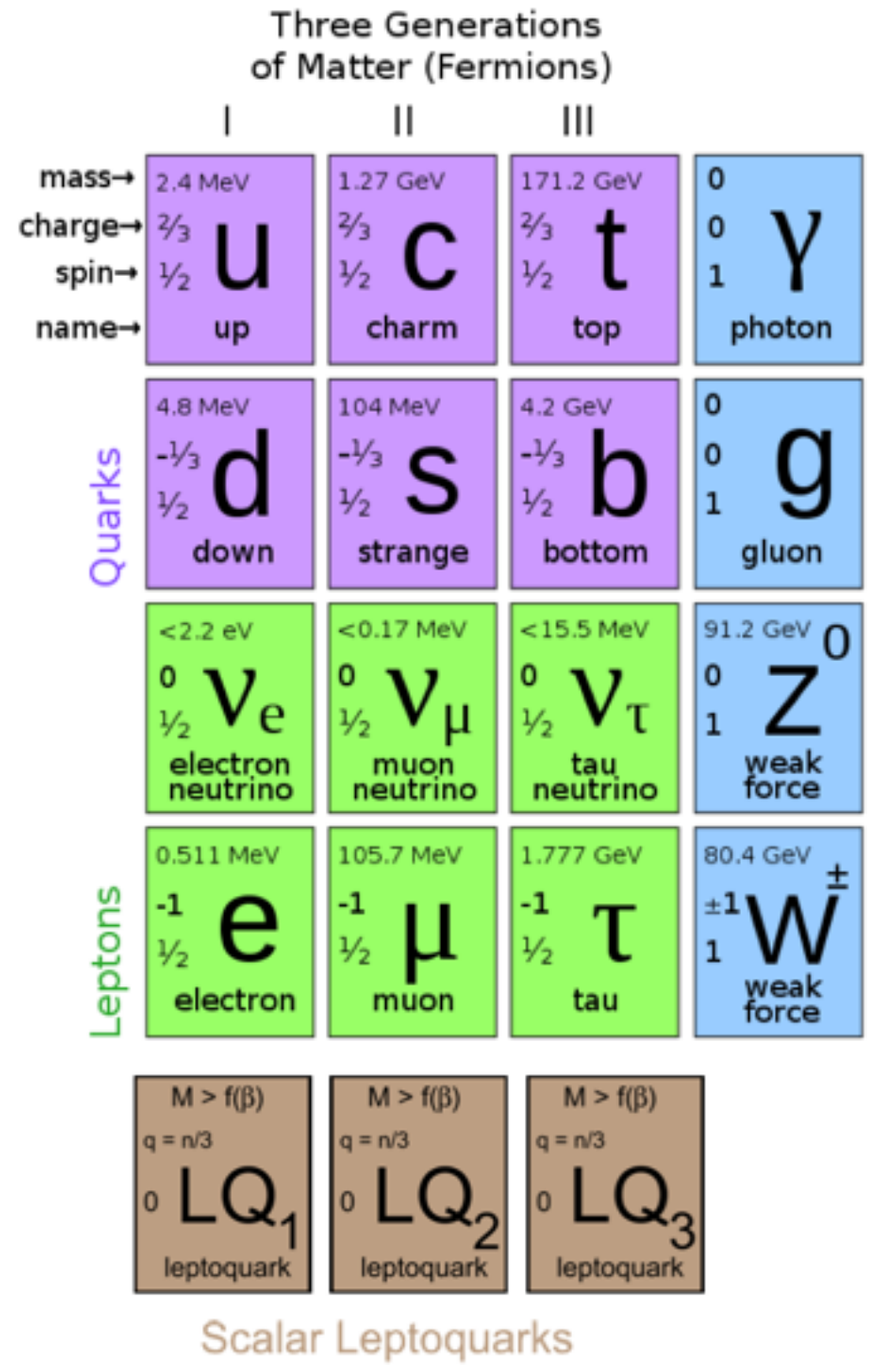


- **Best limits in the 500-800 GeV region**
- Recently ATLAS released similar analysis with 13 TeV data (called "TLA", trigger level analysis) [6]
  - similar sensitivity of CMS 8 TeV, no excess

Leptoquarks (LQ)

- Predicted by many BSM theories: grand unified theories, composite models, technicolor, superstring-inspired, SUSY RPV, and others
- Possible **explanation for observed quark-lepton symmetry of SM**
- Spin 0 or 1, coloured, fractional electric charge, carry both baryon and lepton number
  - proton is stable → baryon and lepton number conserved separately
  - FCNC suppressed in SM → only coupling within each generation

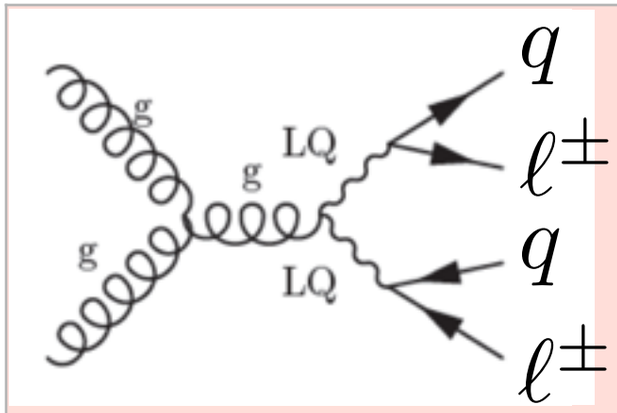




LQ model and signatures

- Pair-production cross section known at NLO
  - independent of unknown l-q-LQ coupling
- Several different final states
  - rich physics program in CMS
  - **interesting signatures also beyond leptoquark models**

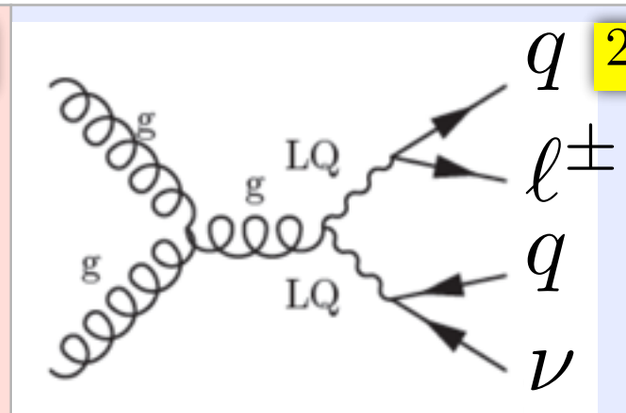
Model parameters	
M_{LQ}	LQ mass
β	$BR(LQ \to \ell^{\pm} q)$
λ	$\ell - q - LQ$ coupling



β^2

2 leptons + 2 jets

EXO-16-007: μμjj (13TeV)
EXO-16-016: ττ+jj (13TeV)
EXO-12-041: eejj, μμjj (8TeV)
EXO-14-008: ττ+tt (8TeV)
EXO-12-032: ττ+bb (8TeV)
EXO-12-043: singleLQ eej, μμj (8TeV)

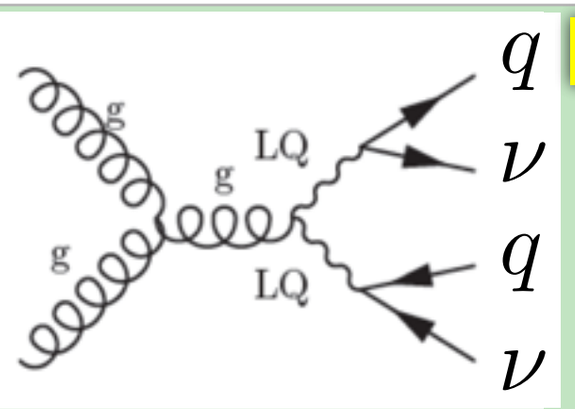


$2\beta(1-\beta)$

1 lepton + 2 jets + MET

EXO-12-041: evjj, μvjj (8 TeV)

Final state covered also by CMS SUSY searches



$(1-\beta)^2$

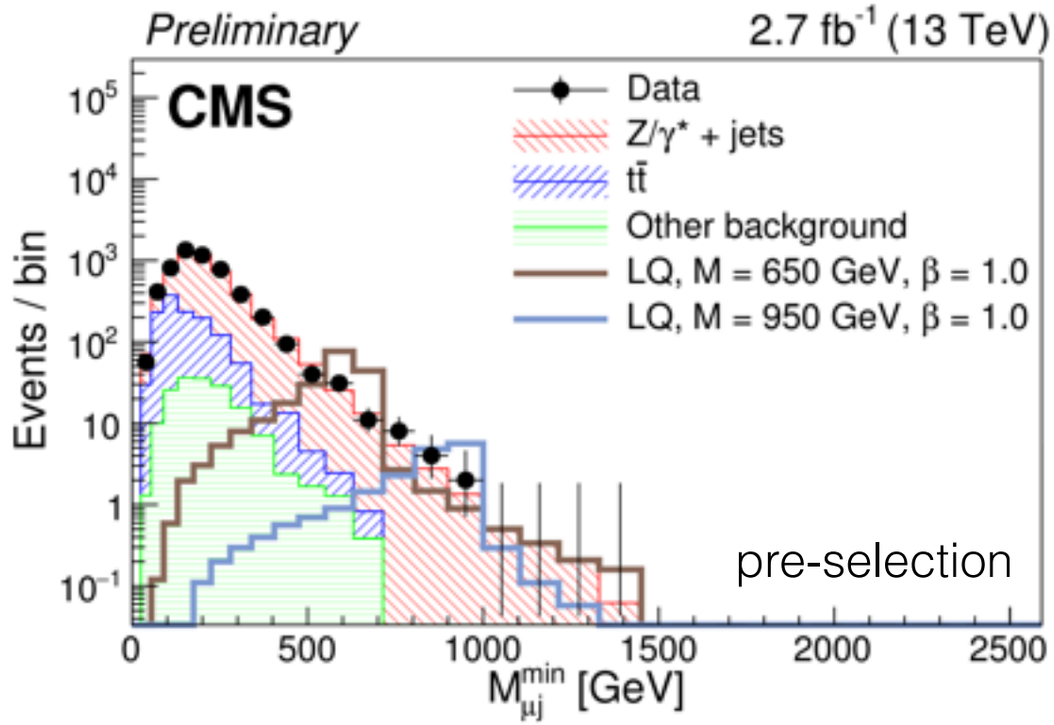
2 jets + MET

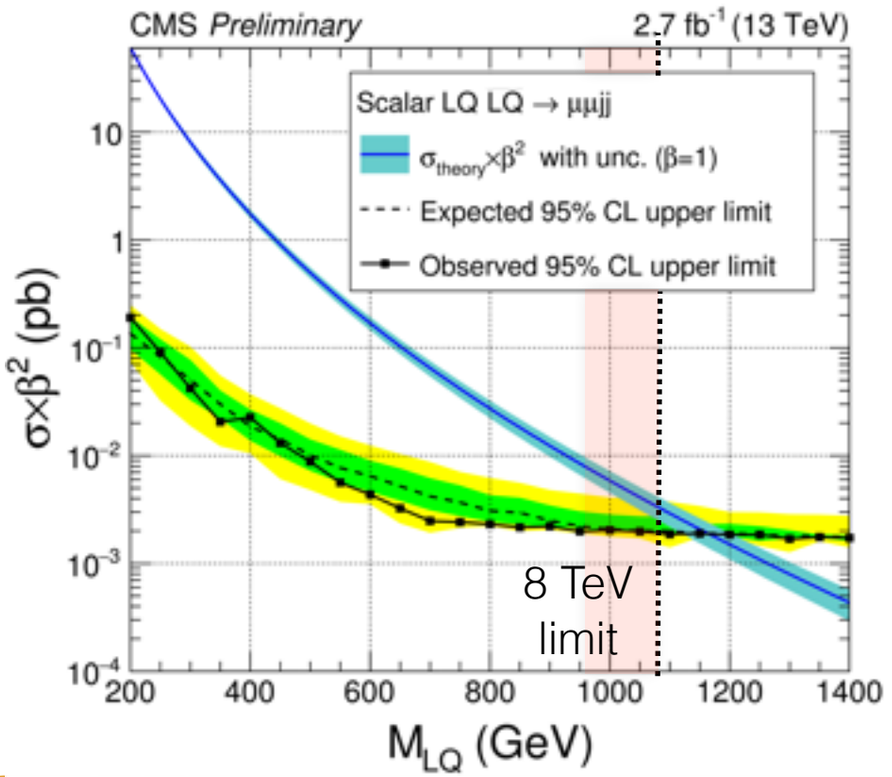
EXO-11-030: vvbb (7 TeV)

Final state covered also by CMS SUSY searches

LQ2 - μμqq

- 2 muons + 2 jets [7]
- Selection optimized for each LQ mass hypothesis
  - $M_{\mu\mu}$: dimuon invariant mass
  - S_T : $p_T(\mu_1) + p_T(\mu_2) + p_T(jet_1) + p_T(jet_2)$
  - $M^{min}_{\mu j}$: smaller of two LQ masses which minimizes LQ-LQ mass difference
- Counting experiment
  - **no excess in data**
- Exclude scalar LQ2 with mass < 1150 GeV and β=1
  - exceeding 8 TeV limits

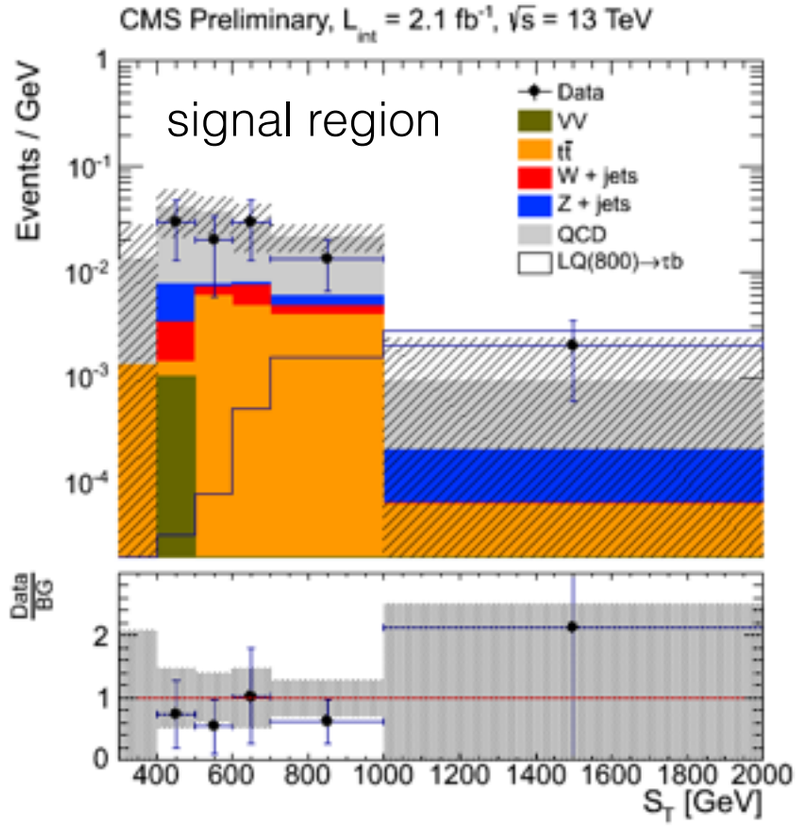


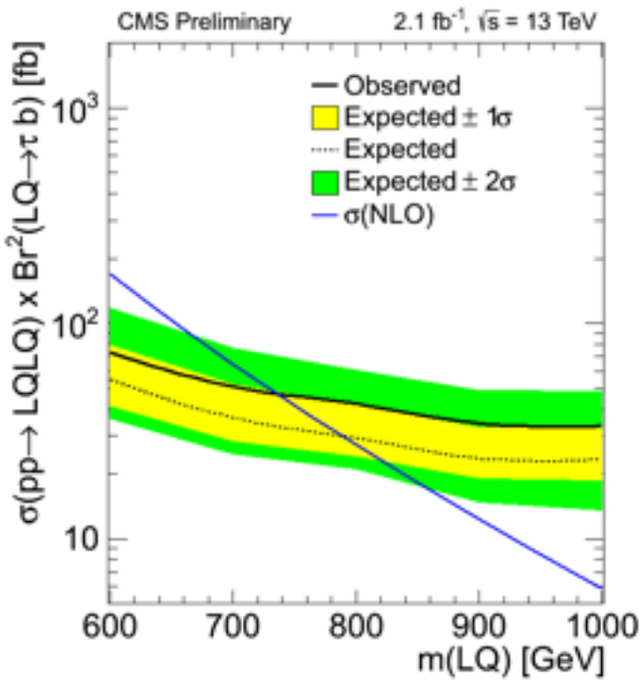


LQ3 - ττbb

NEW

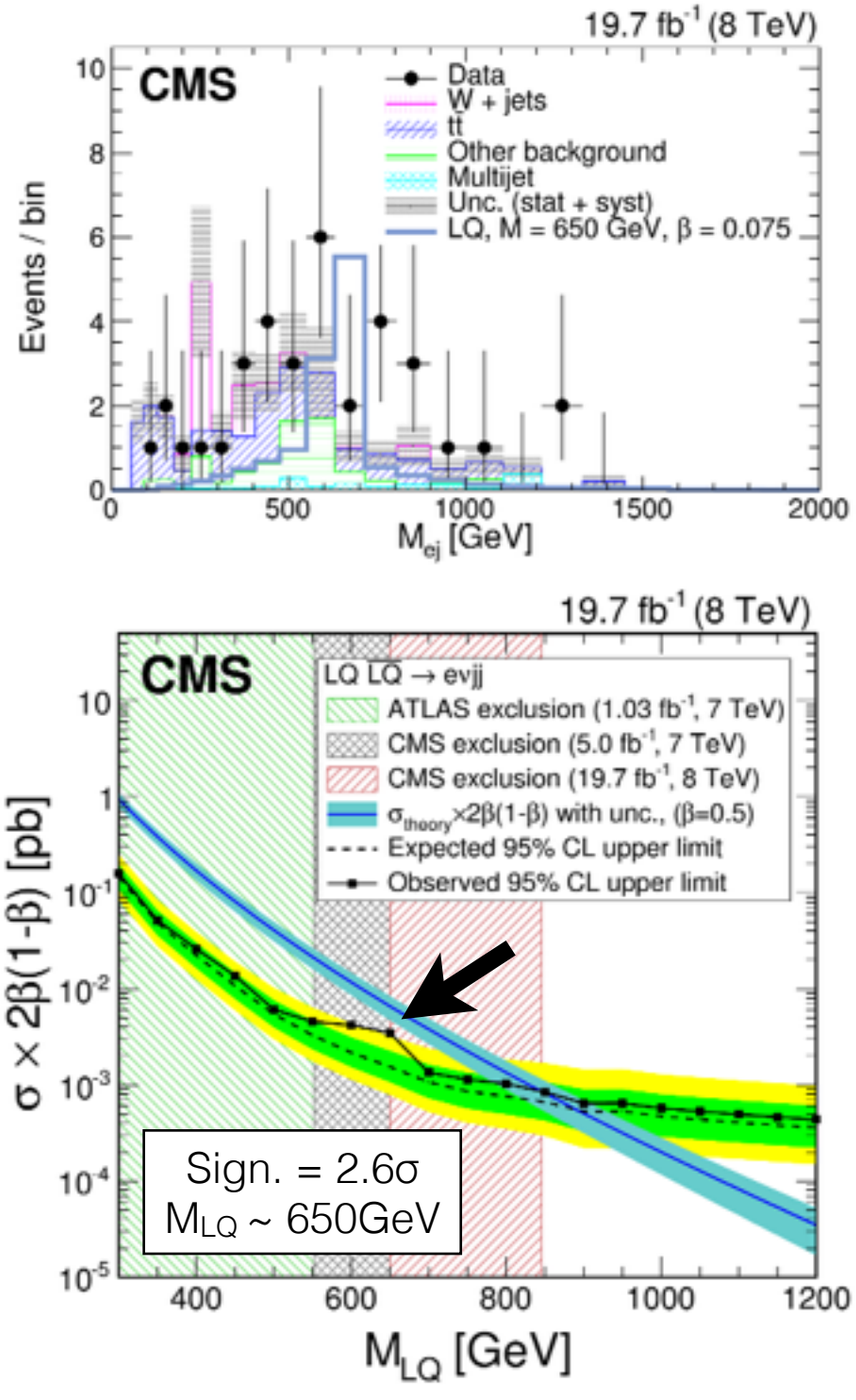
- **First search for LQ3 at 13 TeV LHC**
- 2 taus + 2 jets [8]
  - hadronic tau decays (BR = 42%)
  - no explicit jet b-tagging (model independent)
- Main physics observable
  - **S_T :** $p_T(\tau_1) + p_T(\tau_2) + p_T(jet_1) + p_T(jet_2)$
- Shape analysis
  - data in agreement with predictions
- Exclude scalar LQ3 with mass < 740 GeV and β=1



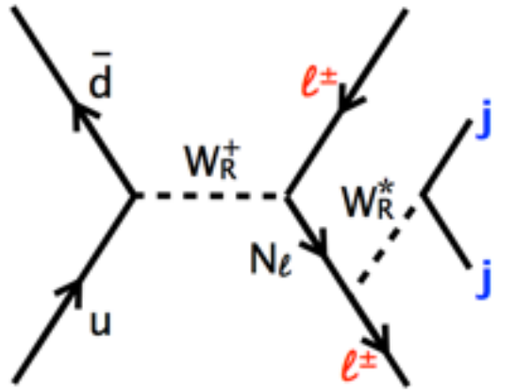


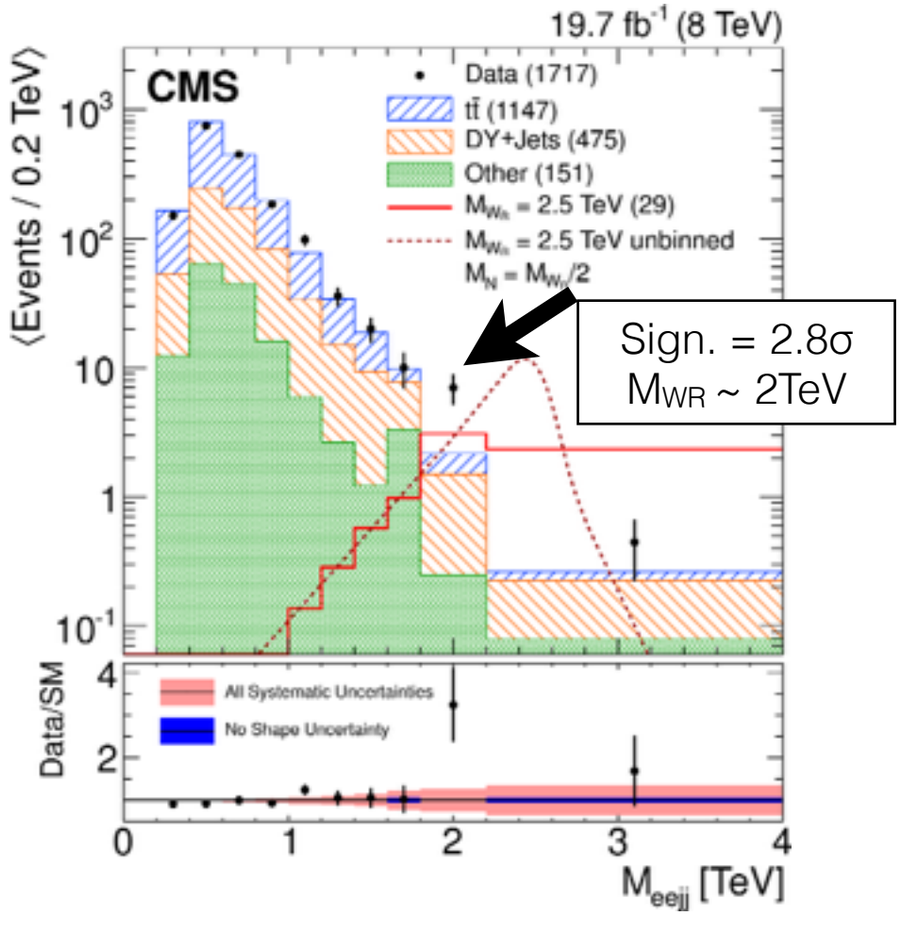
Run 1 fluctuations

LQ1 - evjj [9]



W_R & Heavy Neutrino - eejj [10]





- **2-3σ excess in electron+jets final states**
- No excess in muon channels
- Looking for analysis with 13 TeV data

Conclusions

- **Search for BSM physics continues at CMS**
  - rich physics program in final states with jets and leptons+jets (covered small part in this talk)
- **Dijet resonances**
  - new energy territory for masses > 2 TeV
  - novel *data scouting* technique extend search in sub-TeV mass region; can confirm 750 GeV diphoton excess
- **Leptons+jets searches**
  - many different final states covered in CMS
  - 2-3σ excess in evjj and eejj Run 1 searches
- **Excellent LHC performance in 2016**
  - expect ~10 fb^{-1} for ICHEP2016 in August
  - maybe 40 fb^{-1} by the end of the year
- **Keep eyes open for LHC results !!!**

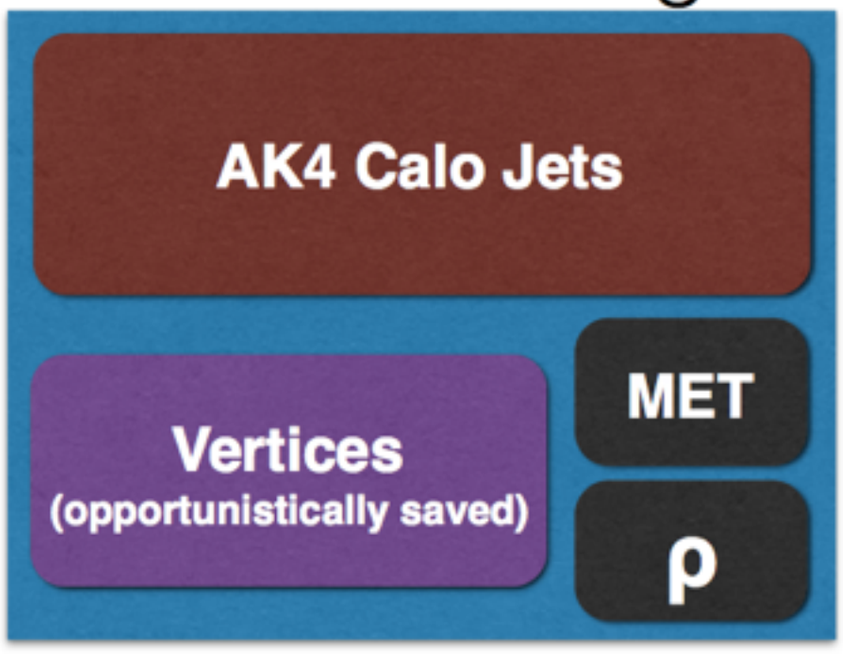
Backup slides

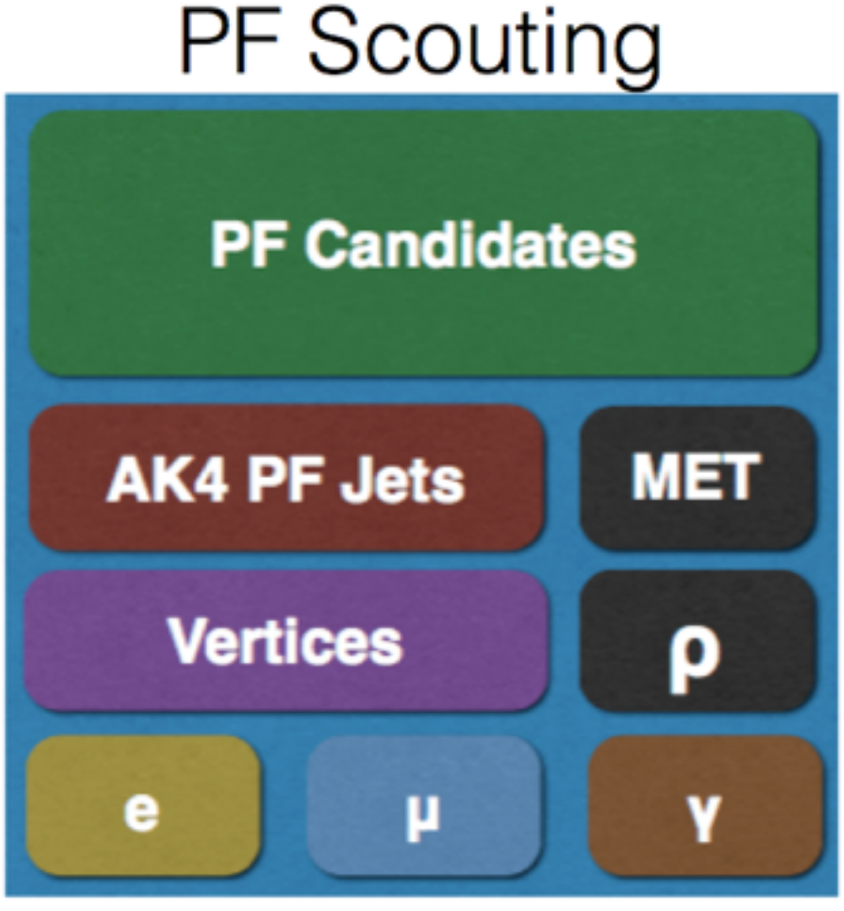
Data Scouting in 2015 (next 3 slides)

Event Content

- **Calo Scouting**
  - Four-momenta of Calojets with pT>20 GeV
  - Vertices (when available), “opportunistically” from other paths in the trigger table
  - Event information
    - energy density ρ (for pile-up subtraction)
    - Missing transverse energy
- **PF Scouting**
  - Four-momenta of relevant physics objects
    - e, μ, γ, PFJets, PF candidates, vertices
  - Event information (as for Calo Scouting, but with tracking)



Typical size: 1.5 kb



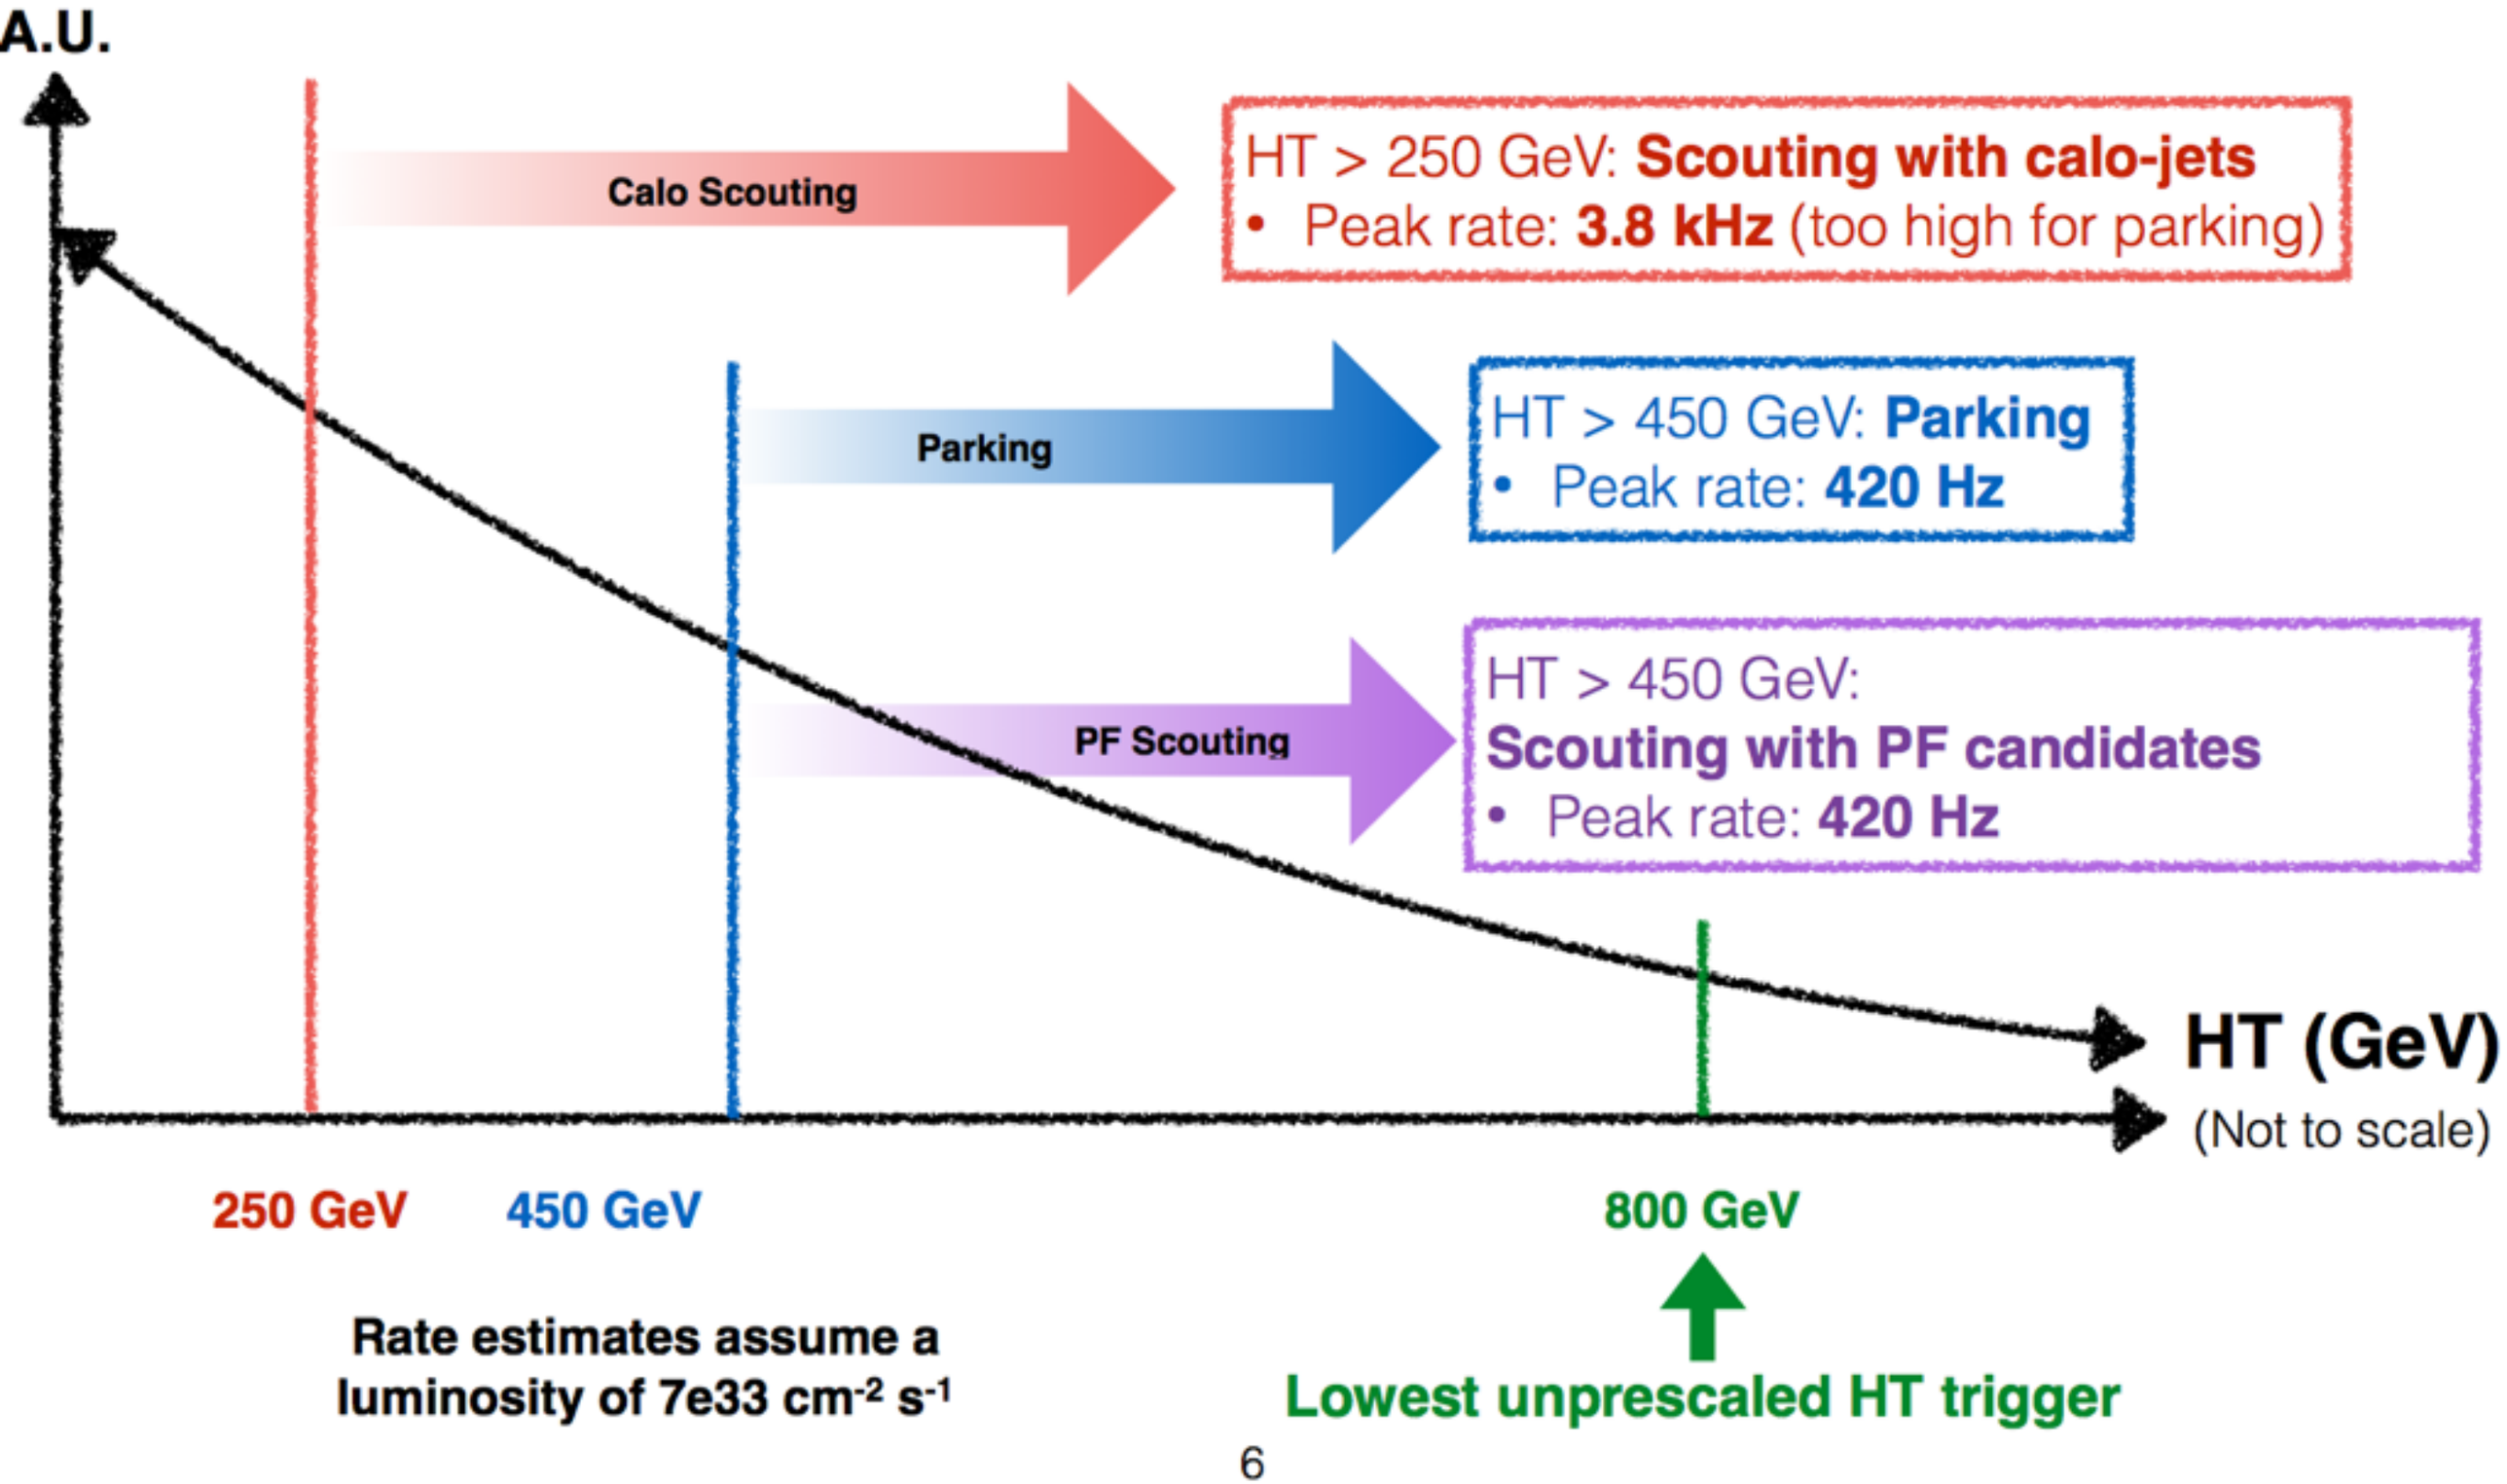
Typical size: 10 kb

Trigger Algorithms

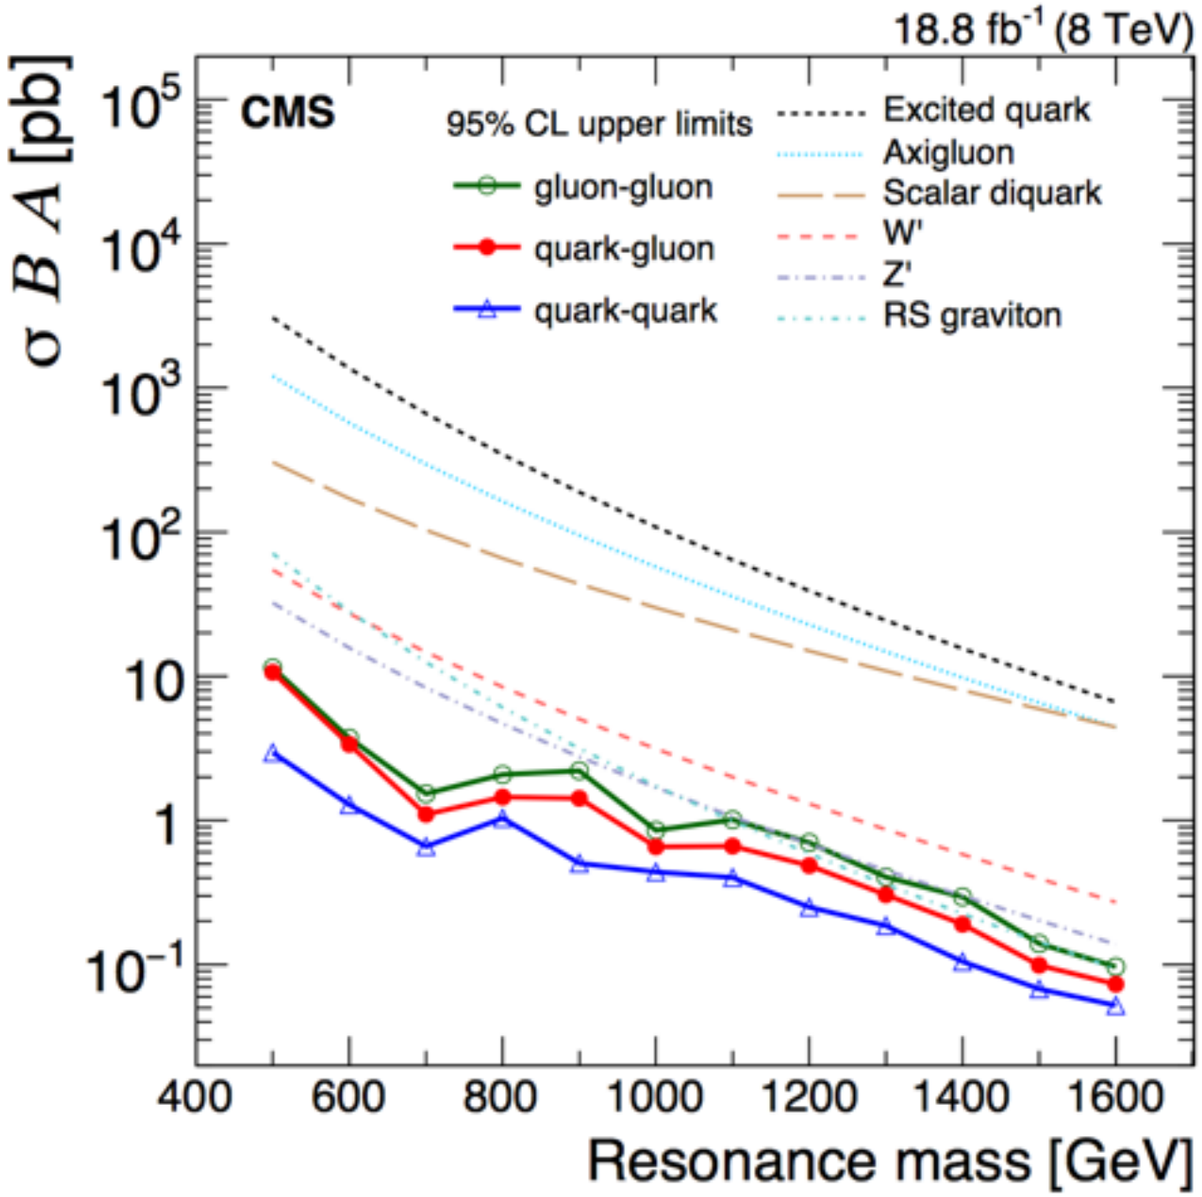
- **Hadronic triggers**
  - collect events with HT above some threshold (PF/Calo scouting)
  - collect events in bins of HT (parking)
- **Muon Trigger**
  - collect events with muon pair having mass > 10 GeV
- **Auxiliary triggers**
  - measure L1-seed turn-on curve
  - measure efficiency of HLT selection

Scouting Trigger Paths	Rate [Hz] @3.2e33 $cm^{-2}s^{-1}$
DST_HT450_PFScouting	100
DST_HT250_CaloScouting	1000
DST_DoubleMu6_Mass10	140
Parking Trigger	**Rate [Hz] @3.2e33 $cm^{-2}s^{-1}$**
HLT_HT450to470	17
HLT_HT470to500	20
HLT_HT500to550	22
HLT_HT550to650	23
HLT_HT650	21
Prescaled Paths (10 Hz each)	**Purpose**
DST_L1HT_PFScouting	Measure HLT turn-ons
DST_L1HT_CaloScouting	Measure HLT turn-ons
DST_CaloJet40_PFScouting	Measure L1 turn-ons
DST_CaloJet40_CaloScouting	Measure L1 turn-ons

EXAMPLE: The HT events



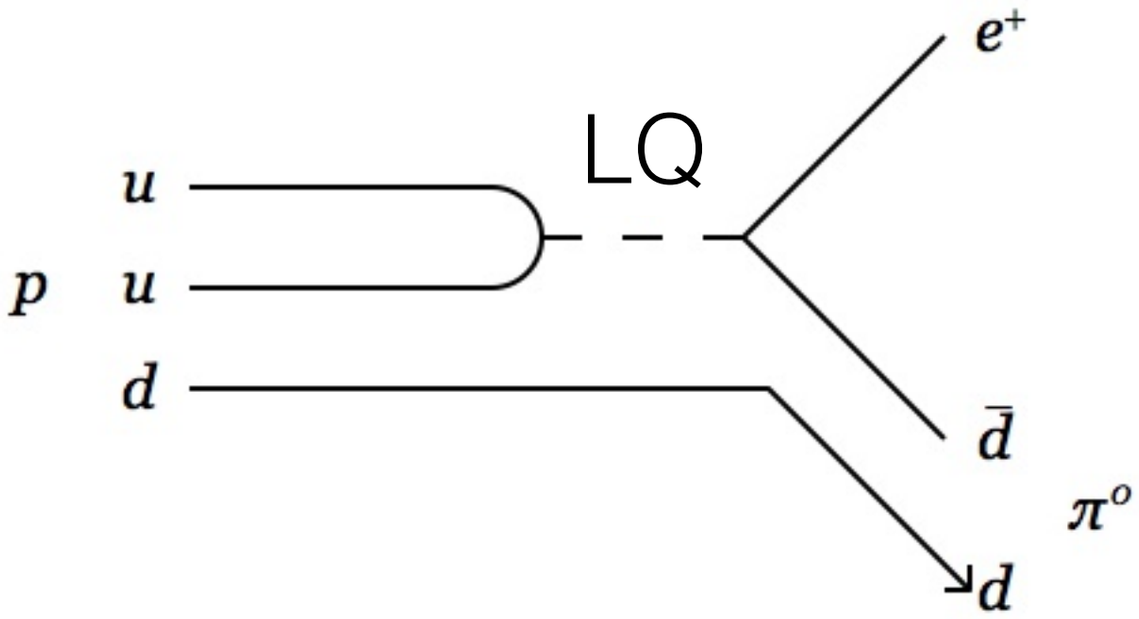
Dijet scouting limits



- Exclude "cross section X branching ratio X acceptance" of about 2 pb at 750 GeV for gg resonances
  - acceptance ~ 60% for scalar resonances

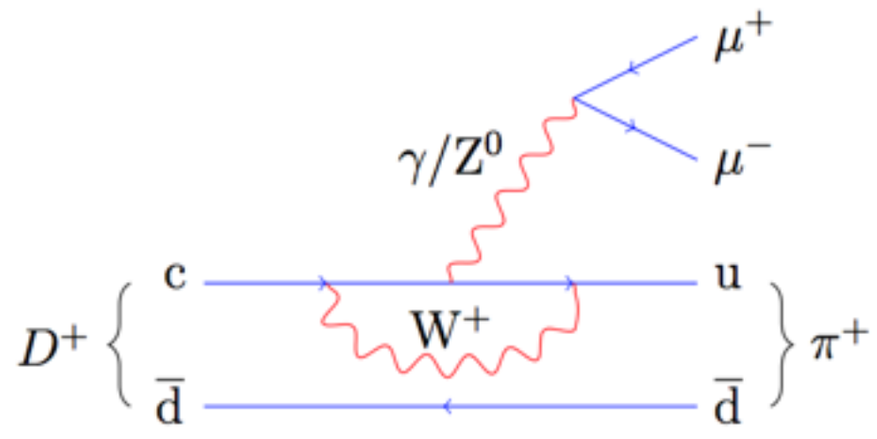
Leptoquark constraints

Proton is stable

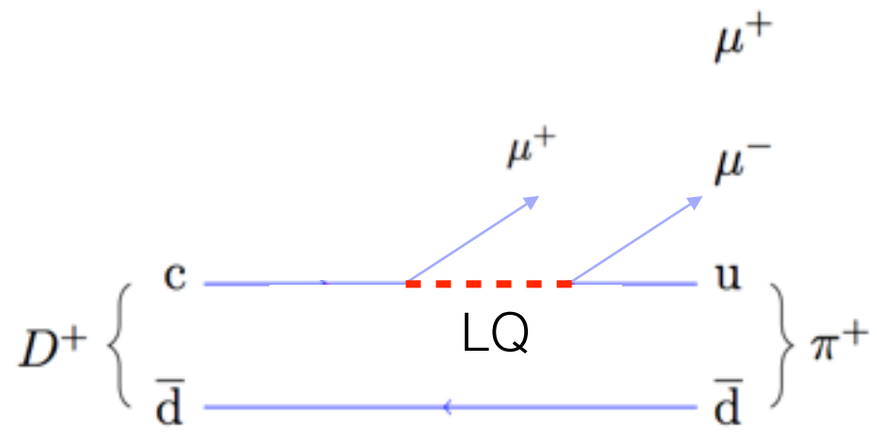


- ⇒LQ must vertices must conserve separately baryon and lepton number

FCNC suppressed in SM



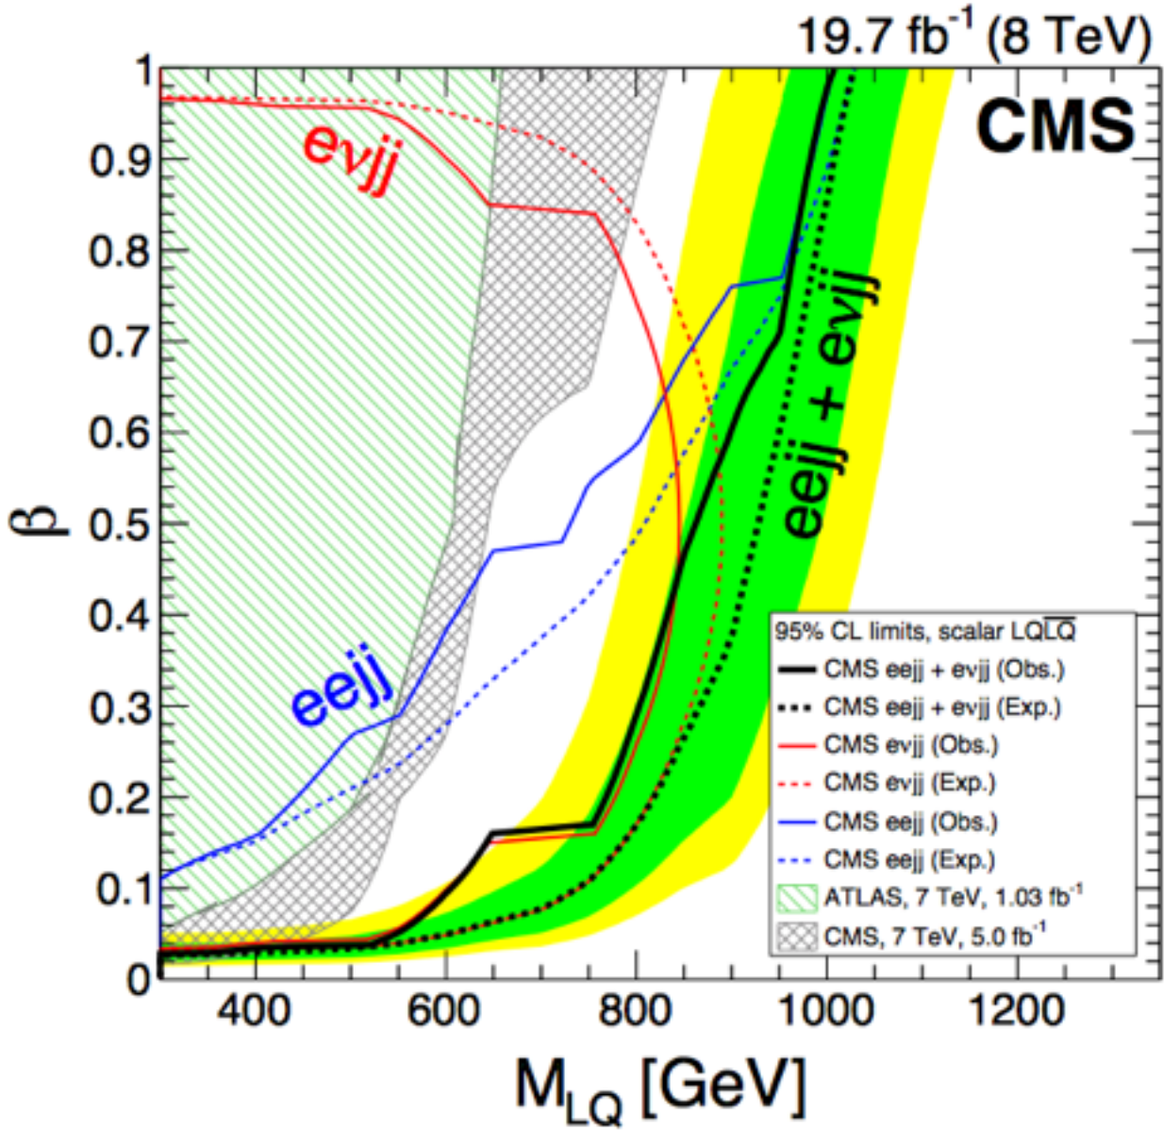
(SM)

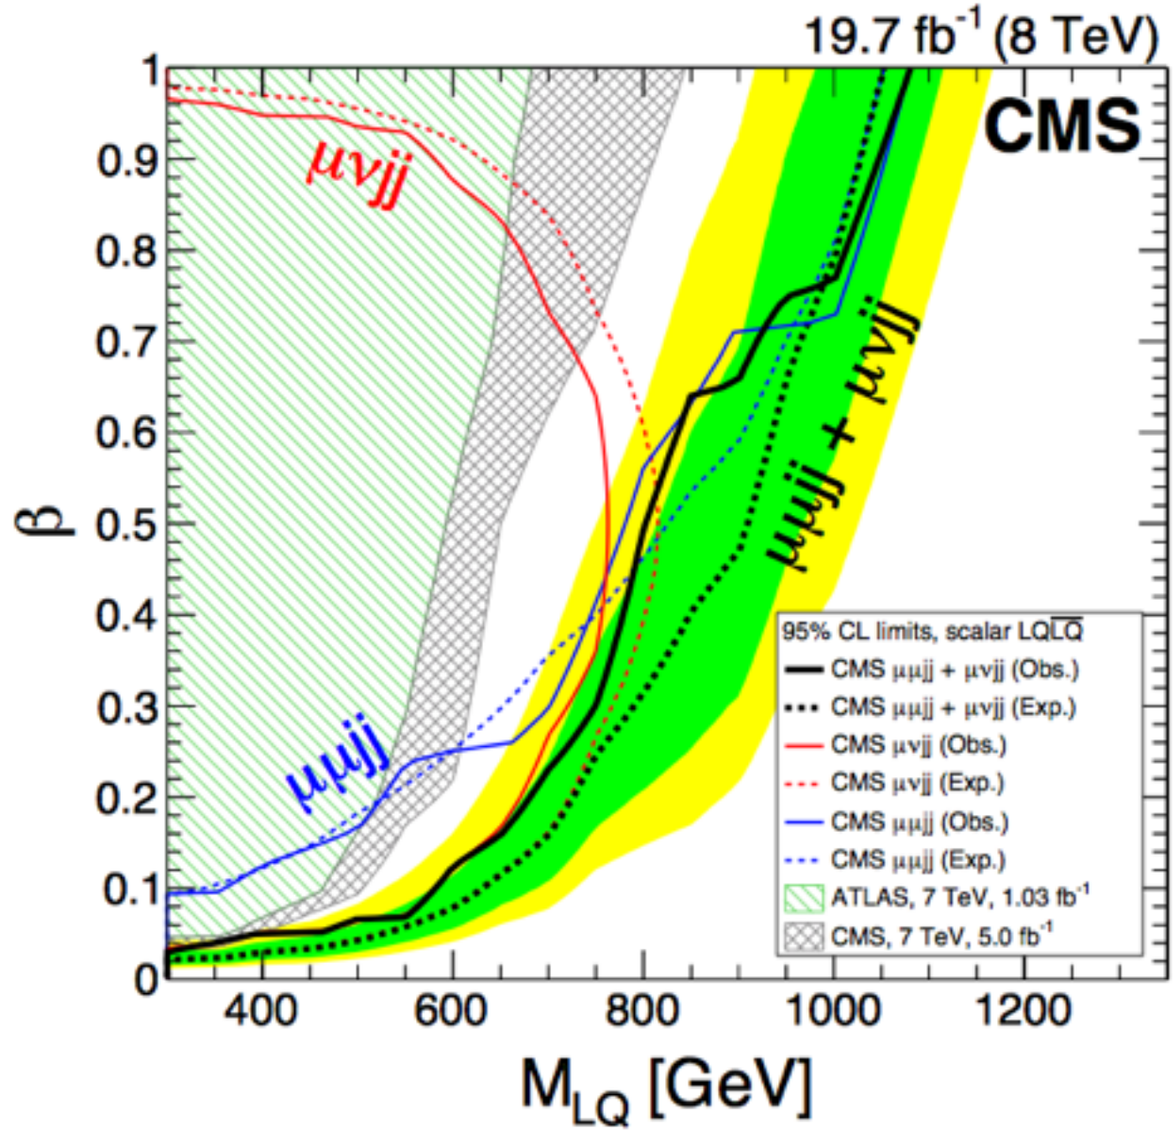


(BSM)

- ⇒LQ only couple within a single generation

LQ1 and LQ2 limits





M(lljj) spectra
