Obiettivo dell'esperimento (Perché $K^+ \rightarrow \pi^+\nu\nu$?)

FLAVOR CHANGING NEUTRAL CURRENT

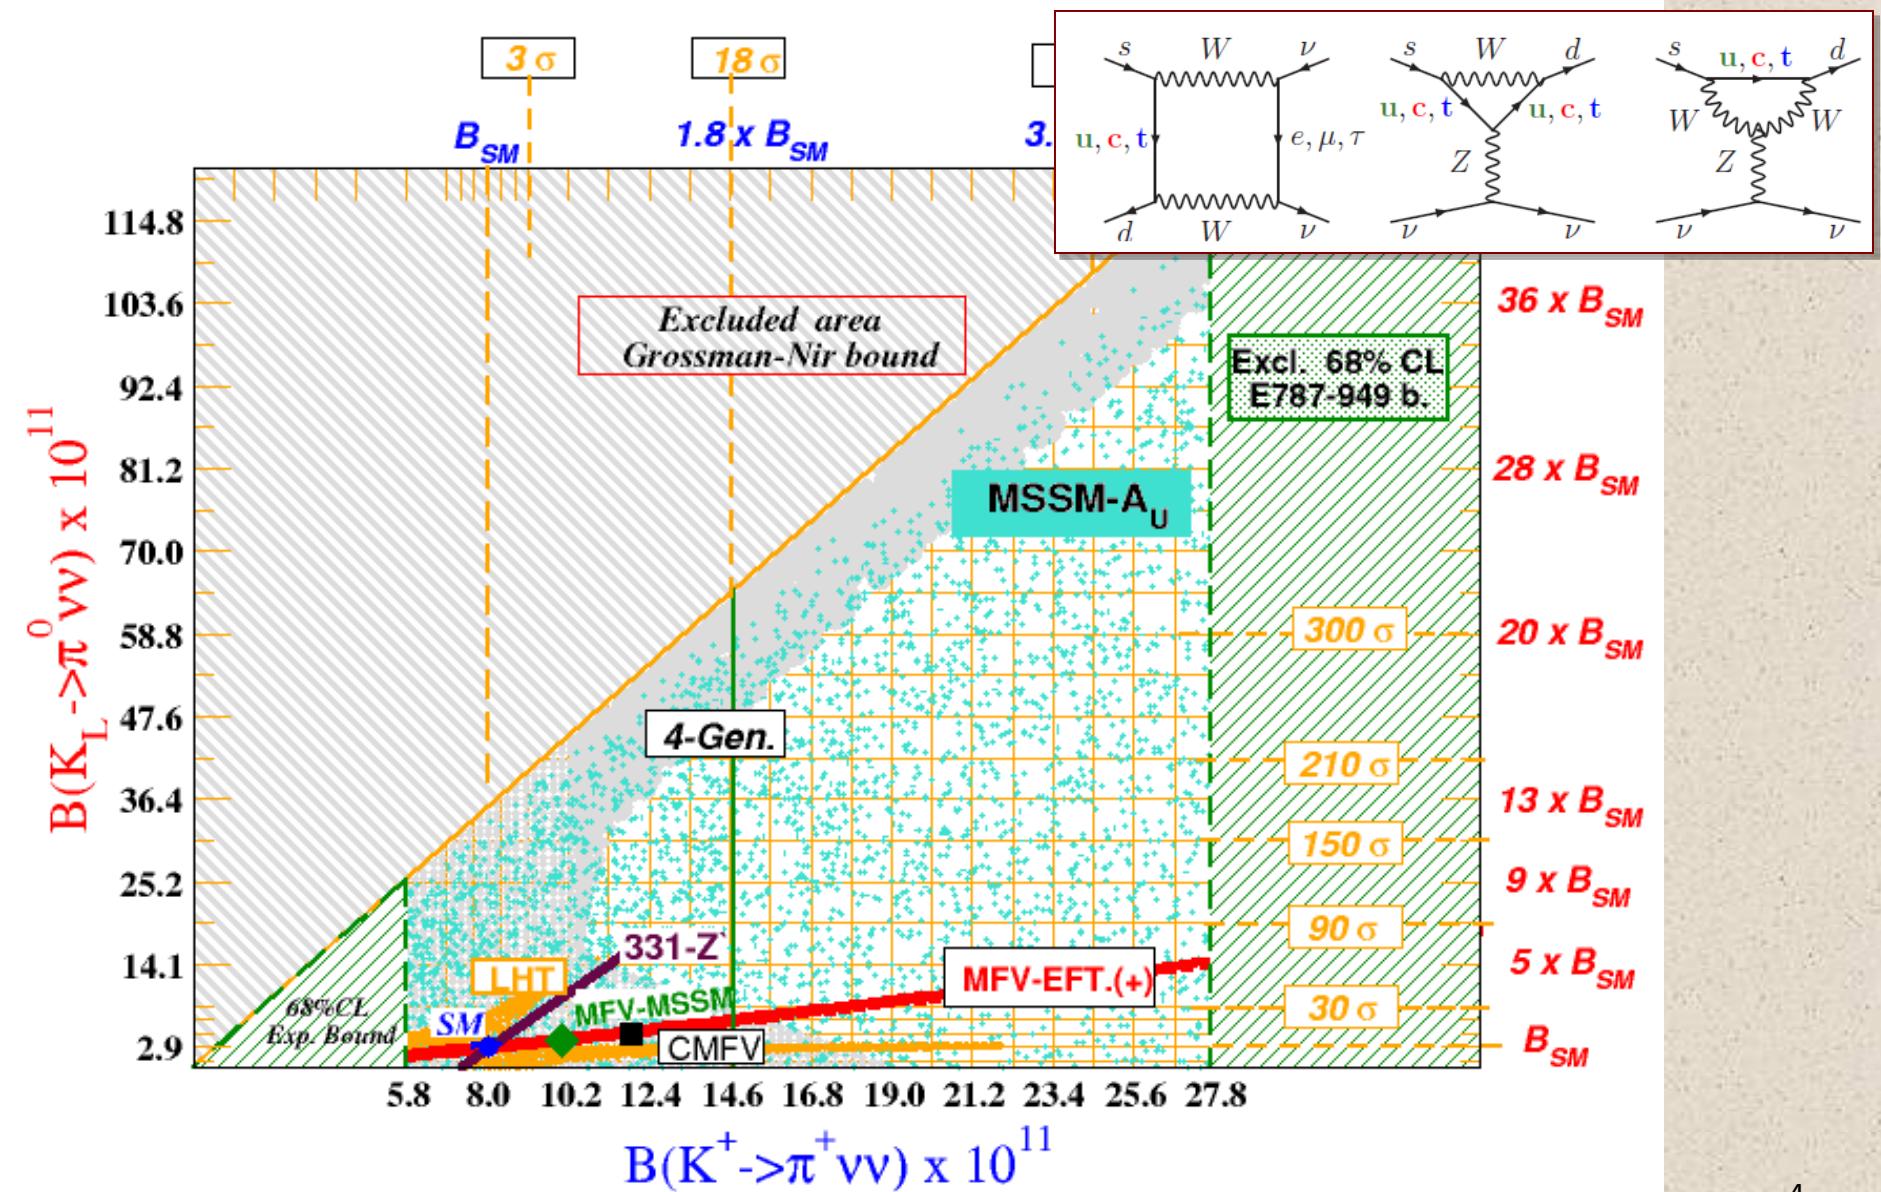

DIAGRAMMI DI FEYNMAN AL SECONDO ORDINE

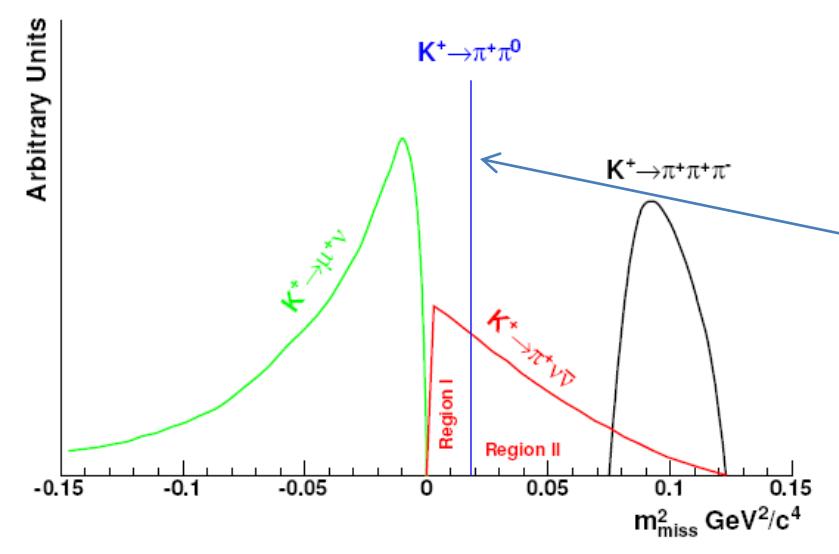

- SENSIBILE ALLA FISICA OLTRE IL MODELLO STANDARD
- FORTE SEGNATURA SPERIMENTALE (nello stato finale solo un π^+)
- $BR(K^+ \rightarrow \pi^+\nu\nu)(SM) = (8.22 \pm 0.84) \cdot 10^{-11}$
- $BR(K^+ \rightarrow \pi^+\nu\nu)(EXP) = (17.3^{+11.5}_{-10.5}) \cdot 10^{-11}$
(7 events@E787/E989, Phys. Rev. Lett. 101, 191082 (2008))

Obiettivo dell'esperimento

Decadimenti di fondo

$K^+ \rightarrow \mu^+ \nu_\mu$ 63%
 $K^+ \rightarrow \pi^+ \pi^0$ 21%
 $K^+ \rightarrow \pi^+ \pi^+ \pi^-$ 5%

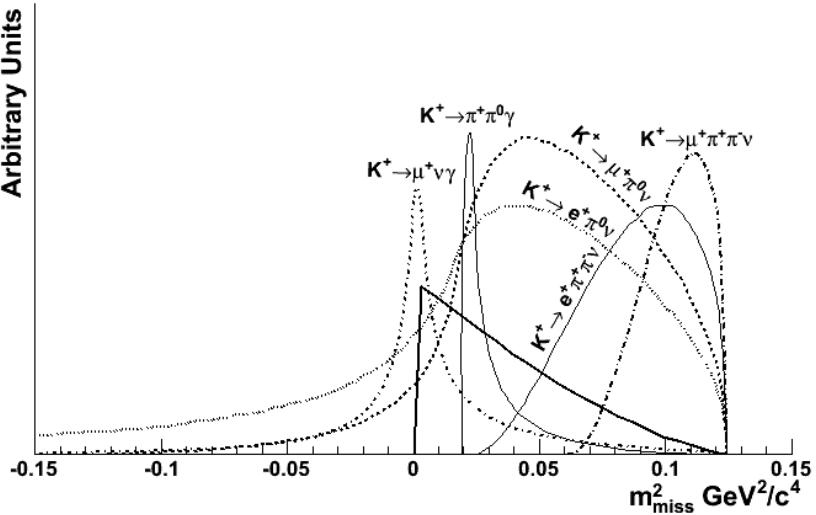

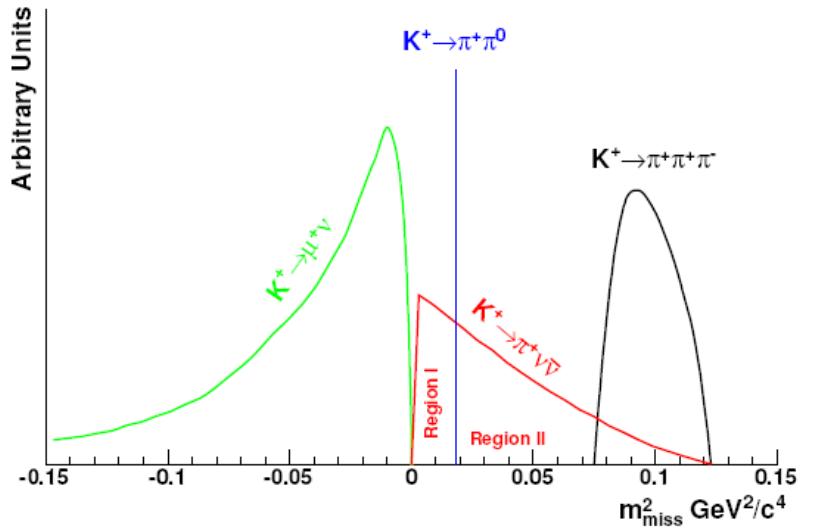

Oltre alla condizione su m_{miss} si
elimina fondo selezionando eventi
con $P_{\pi^+} < 35 \text{ GeV}/c$.

$$m_{\text{miss}}^2 \equiv (P_K - P_\pi)^2$$

$$m_{\text{miss}}^2 \approx m_K^2 \left(1 - \frac{|P_\pi|}{|P_K|}\right) + m_\pi^2 \left(1 - \frac{|P_K|}{|P_\pi|}\right) - |P_K| |P_\pi| \theta_{\pi K}^2$$

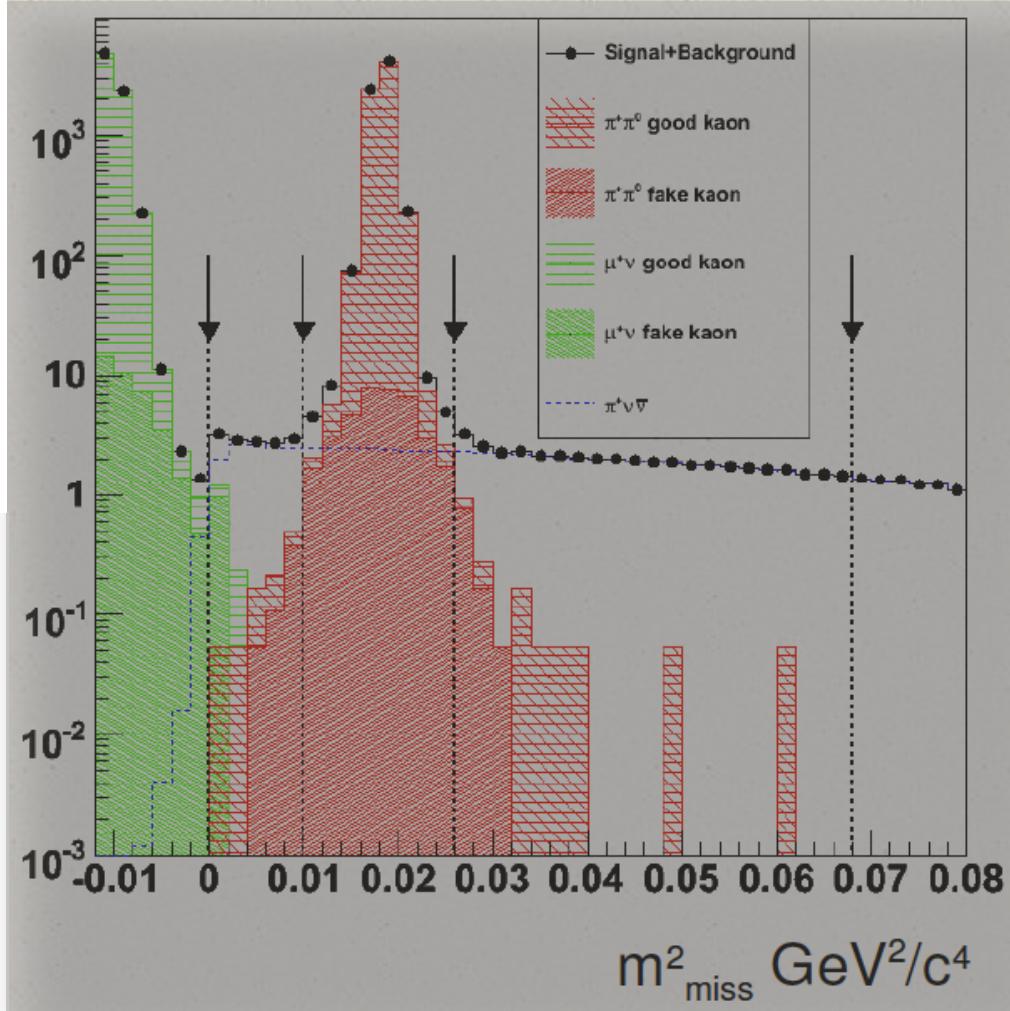

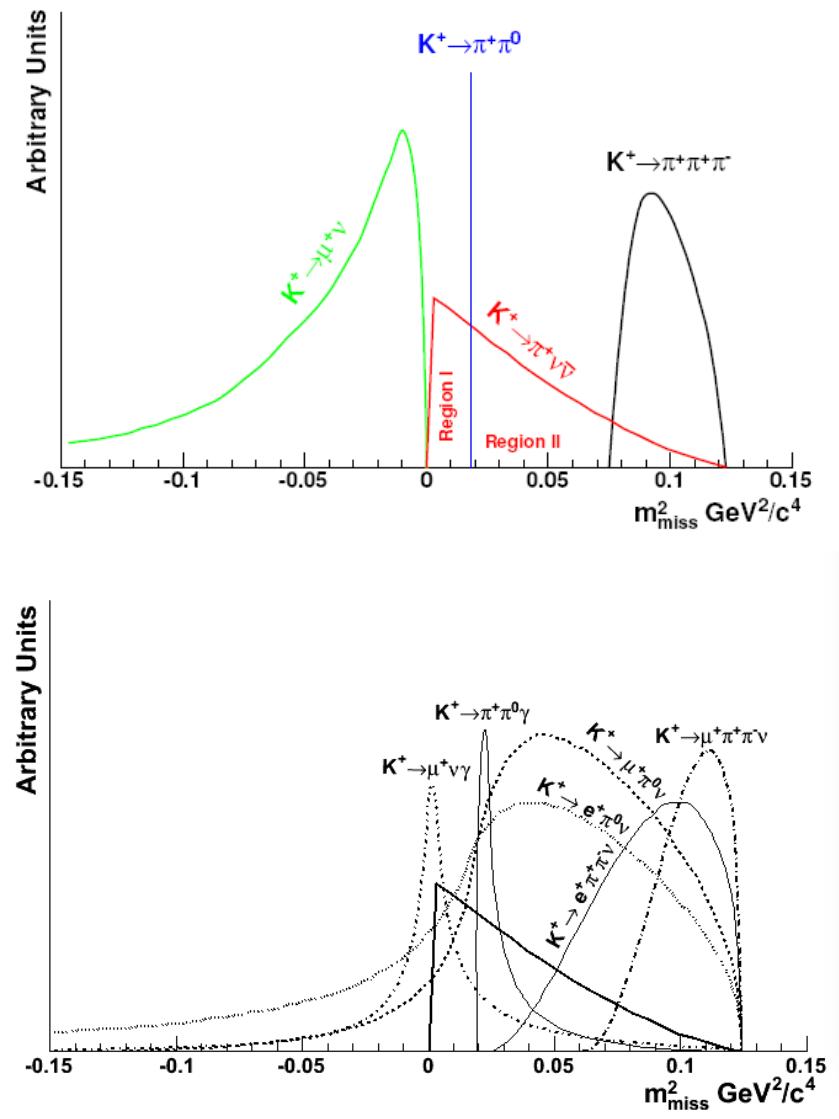

$$\left| \overrightarrow{P_{\pi^0}} \right| = \left| \overrightarrow{P_{K^+}} \right| - \left| \overrightarrow{P_{\pi^+}} \right| \geq 40 \text{ GeV}/c \longrightarrow 2\gamma$$

Decadimenti di fondo

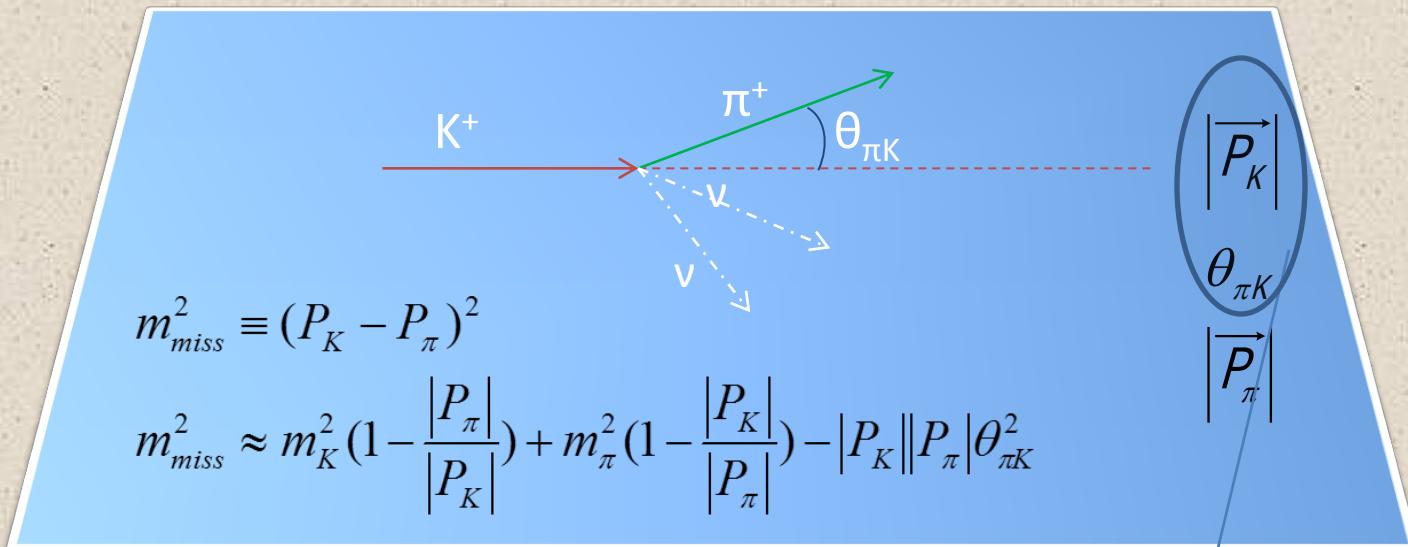

- $K^+ \rightarrow \mu^+ \nu \gamma$
- $K^+ \rightarrow \pi^+ \pi^0 \gamma$
- $K^+ \rightarrow e^+ \pi^+ \pi^- \nu$
- $K^+ \rightarrow e^+ \pi^0 \nu$
- $K^+ \rightarrow \mu^+ \pi^+ \pi^- \nu$
- $K^+ \rightarrow \mu^+ \pi^0 \nu$

Decadimenti di fondo

Identificazione eventi

- ❖ Kinematical rejection ($\sim 10^{-4}$)
- ❖ Particle identification and timing ($\sim 10^{-3}$)
- ❖ Photon/Muon Veto ($\sim 10^{-5}$)

Impose requirements on GigaTracker:
 $\sigma(p_k)/p_k \approx 0.2\%$, $\sigma(\theta_k) \approx 16 \mu\text{rad}$, $\sigma(t) < 200 \text{ ps}$

Identificazione eventi

1. KINEMATICAL REJECTION

- K^+ time, direction, momentum (GTK)
- π^+ (and charged part.) time, direction, momentum (STRAW)

$$|\vec{P}_K|, |\vec{P}_\pi|, \theta_{\pi K}$$

2. PARTICLE IDENTIFICATION

- K^+ identification (CEDAR)
- π^+/μ separation (RICH)

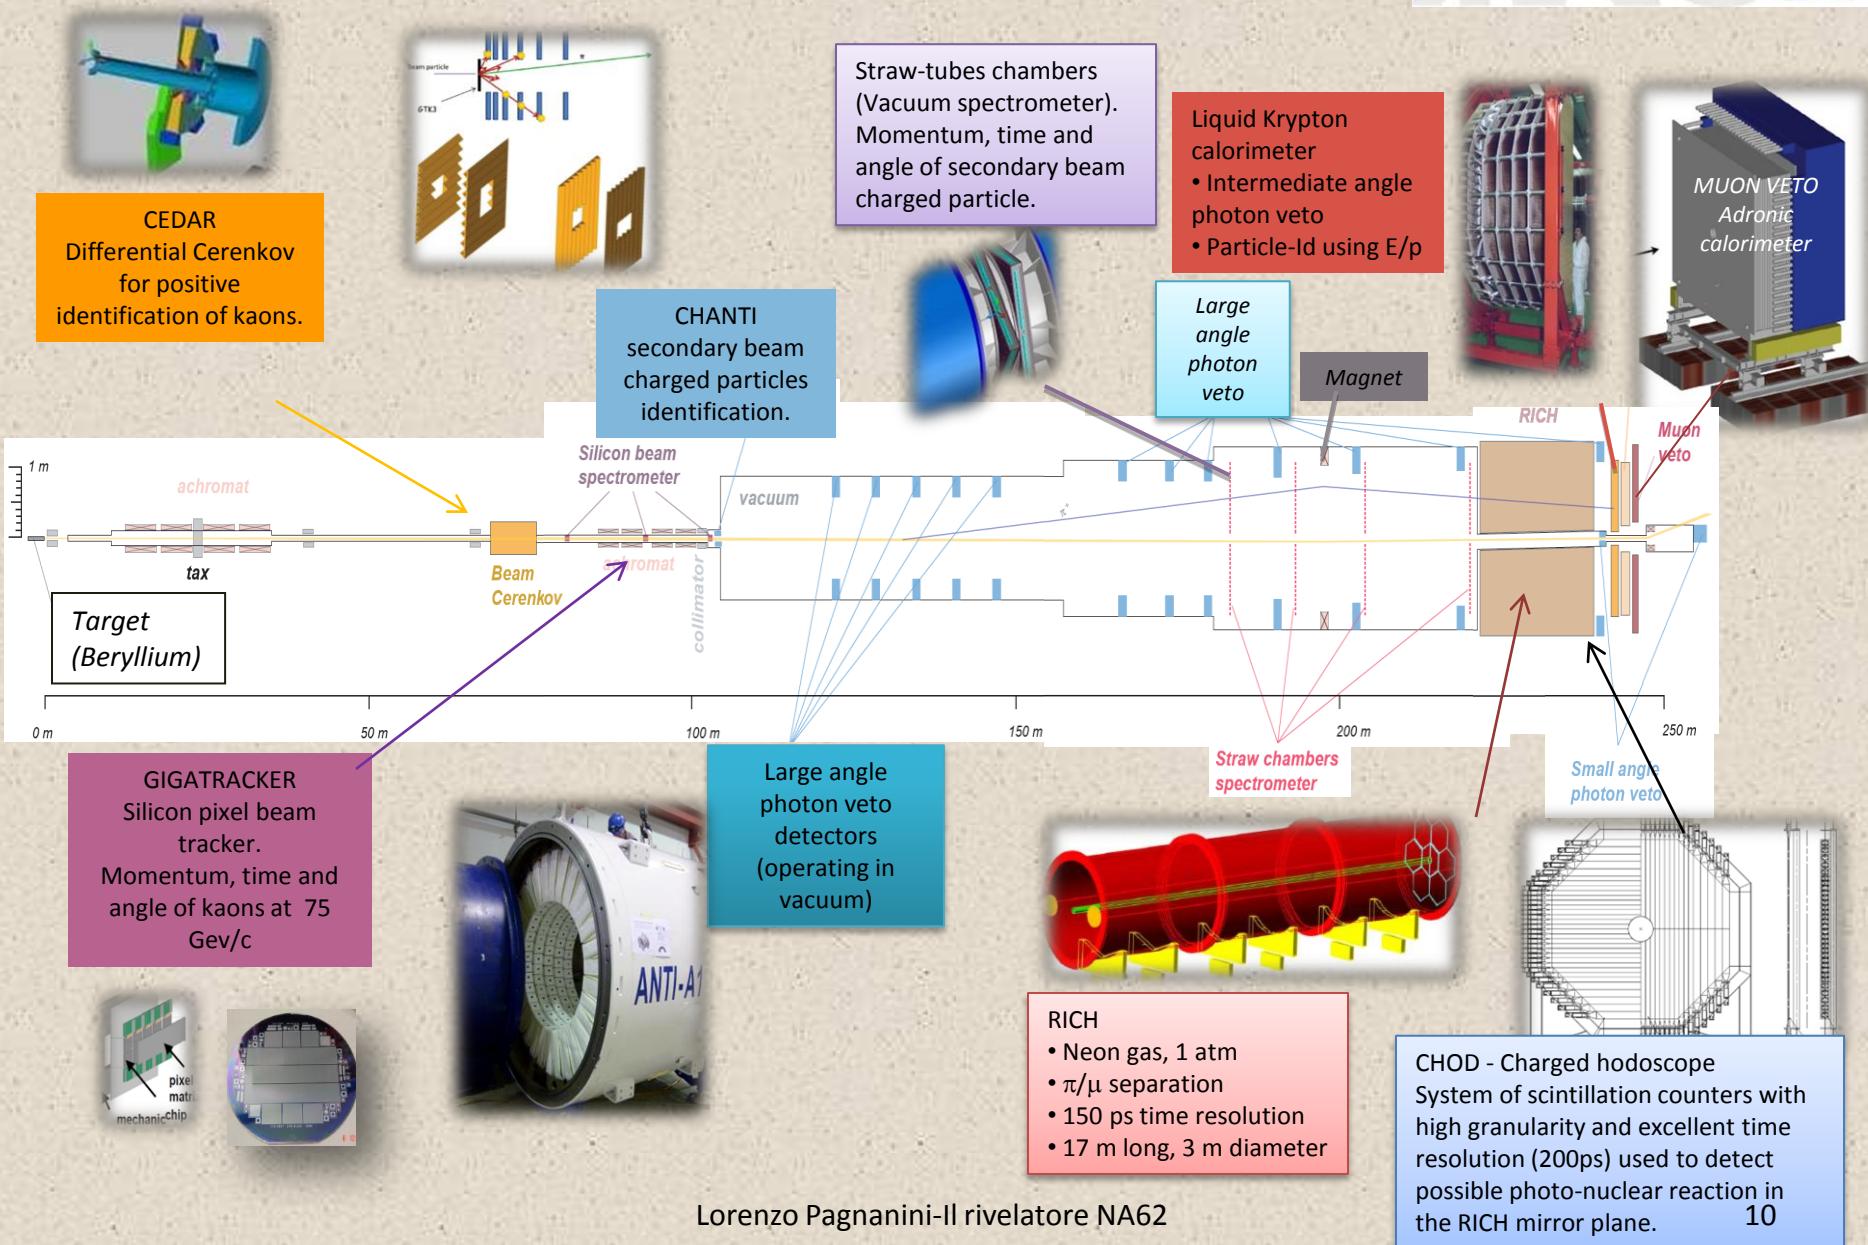

3. VETO

- Photon Veto detector (LKr, IRC,SAC, LAV)
- Muon Veto detector (MUV)
- Charged particle veto detector (CHANTI)

INOLTRE

- Minimize interaction (Multiple scattering) → low mass detector, vacuum
- Statistics (Ultra Rare decay – exp. uncert.) → high intensity beam
(time resolution request)

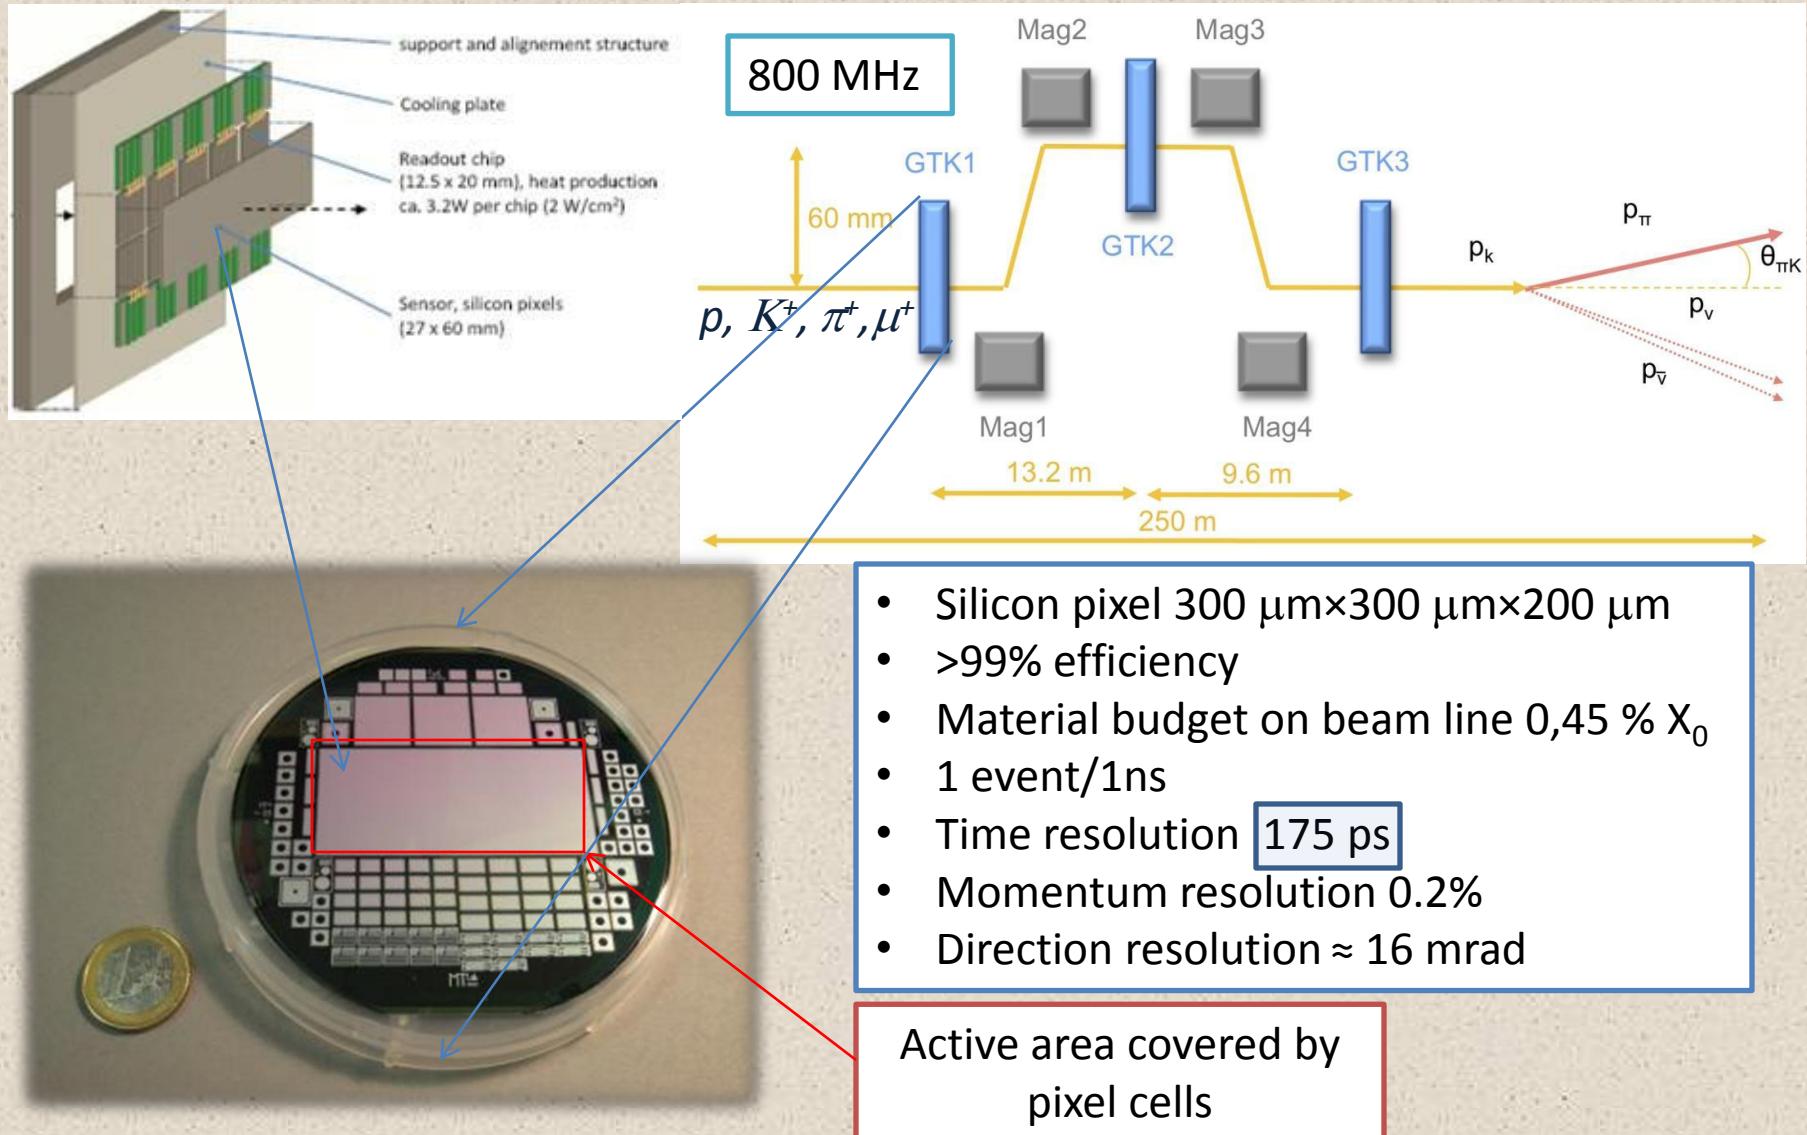

Apparato sperimentale

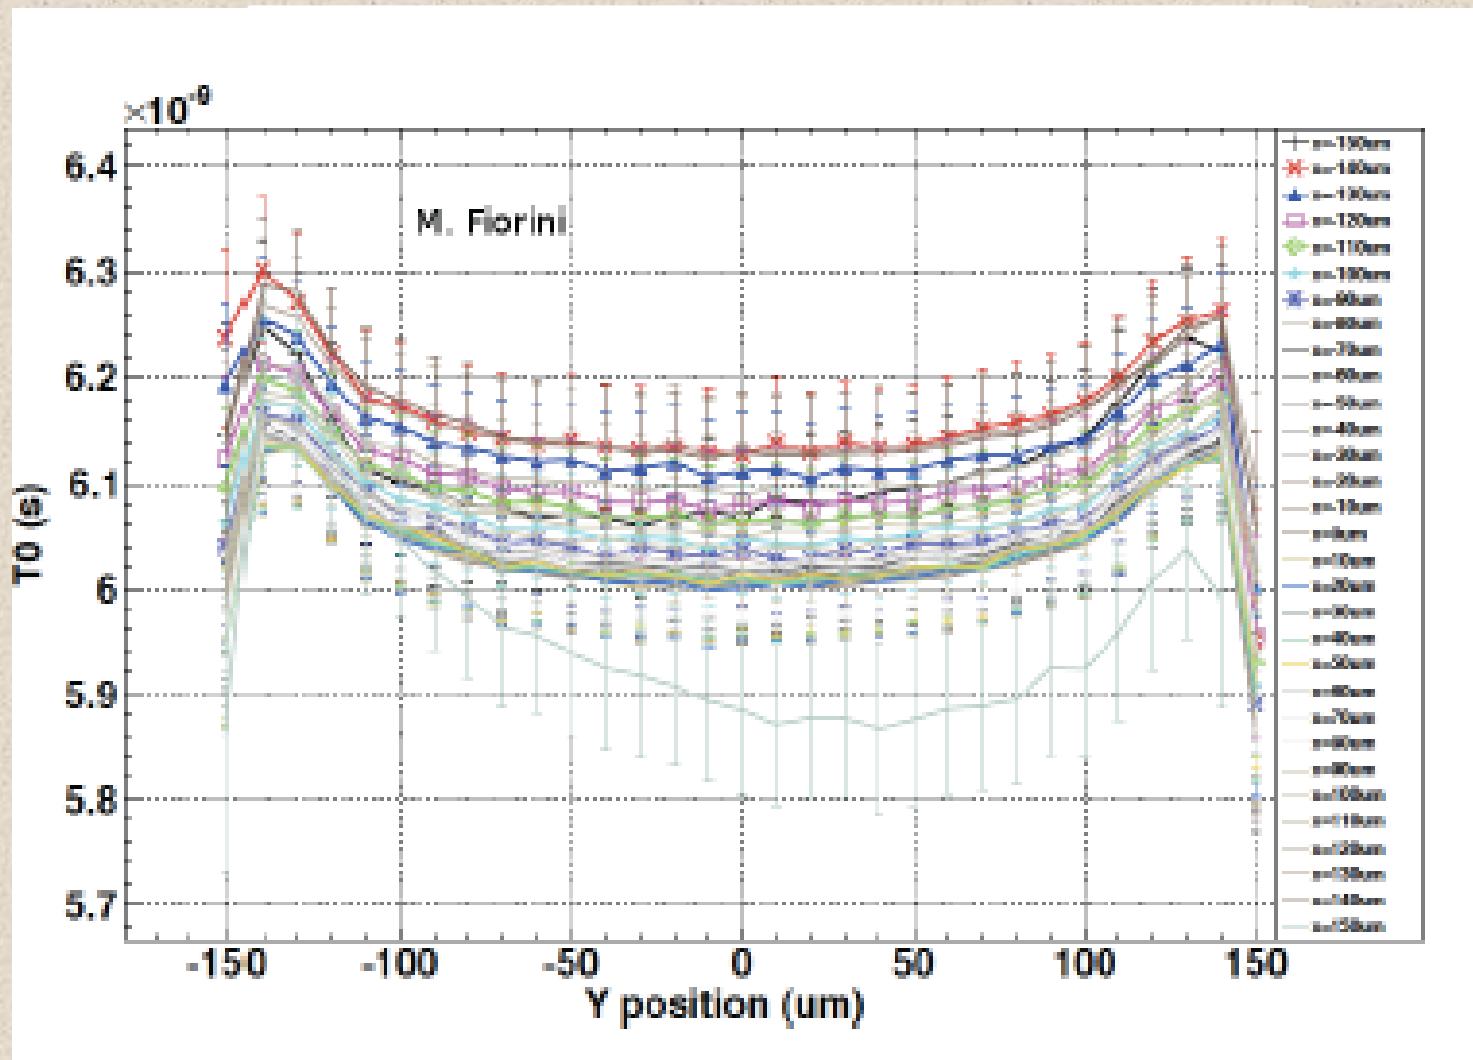

CHOD - Charged hodoscope
System of scintillation counters with high granularity and excellent time resolution (200ps) used to detect possible photo-nuclear reaction in the RICH mirror plane.

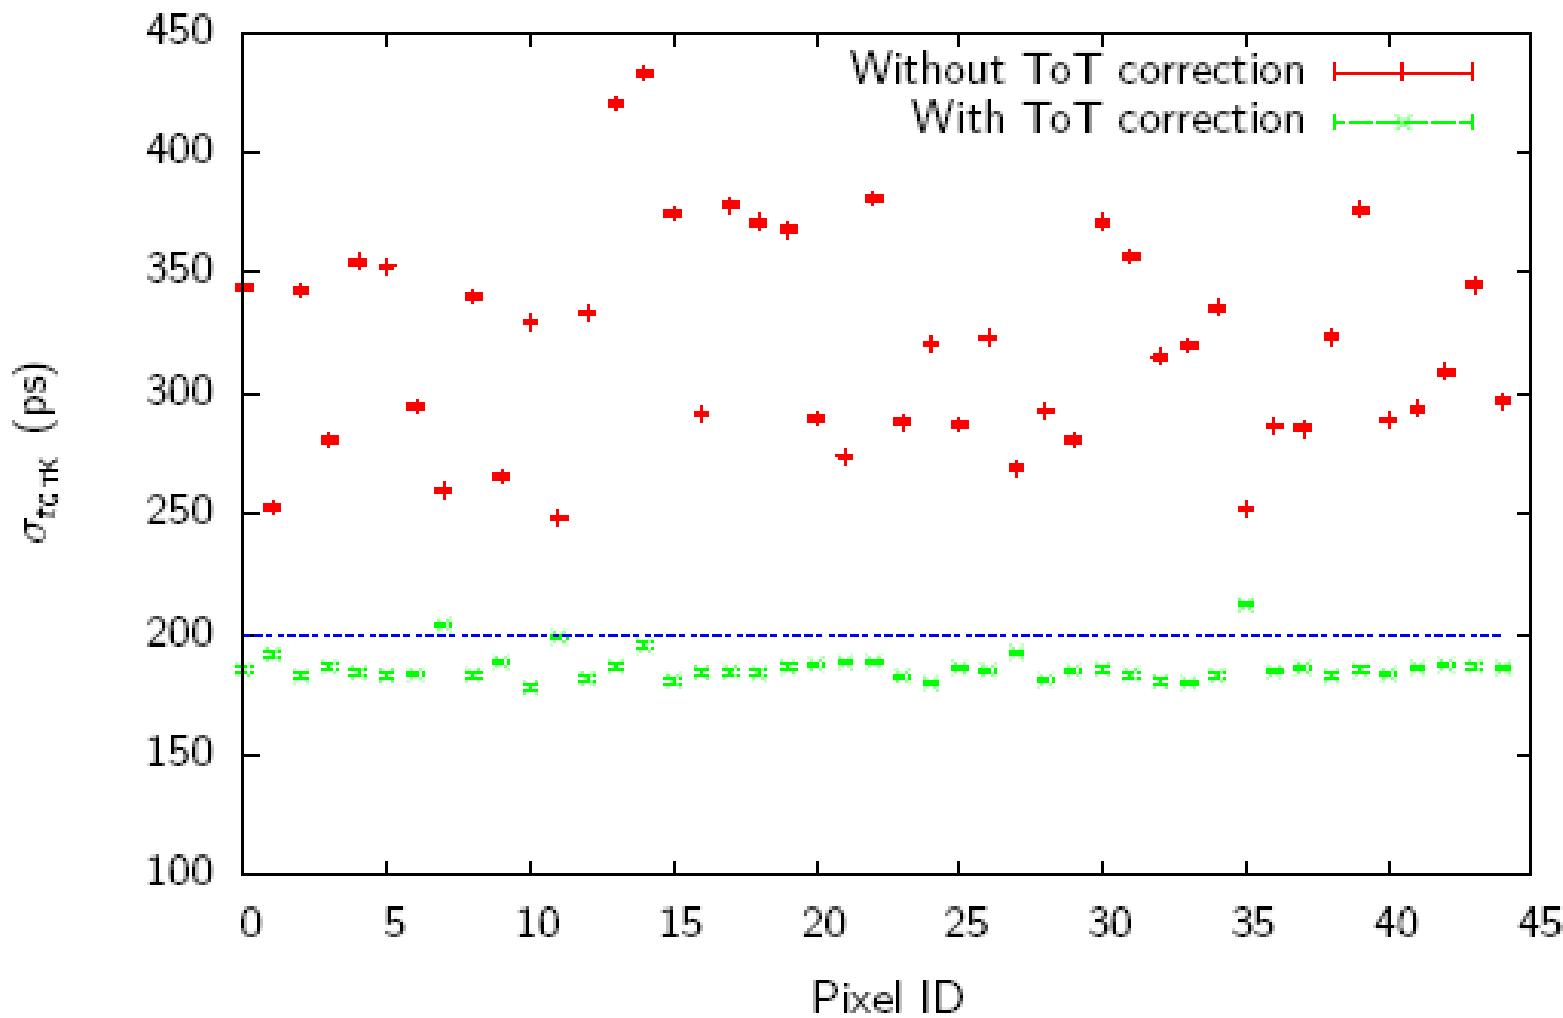

10

GIGATRACKER

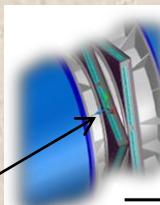

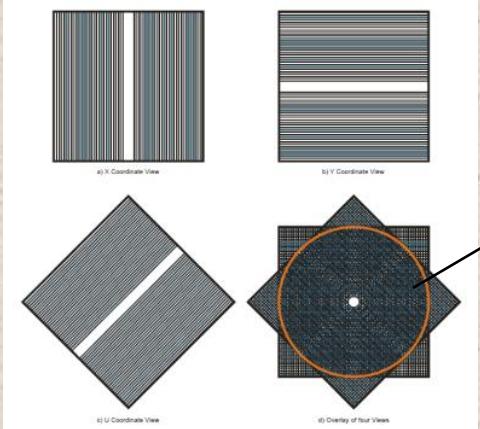

GIGATRACKER

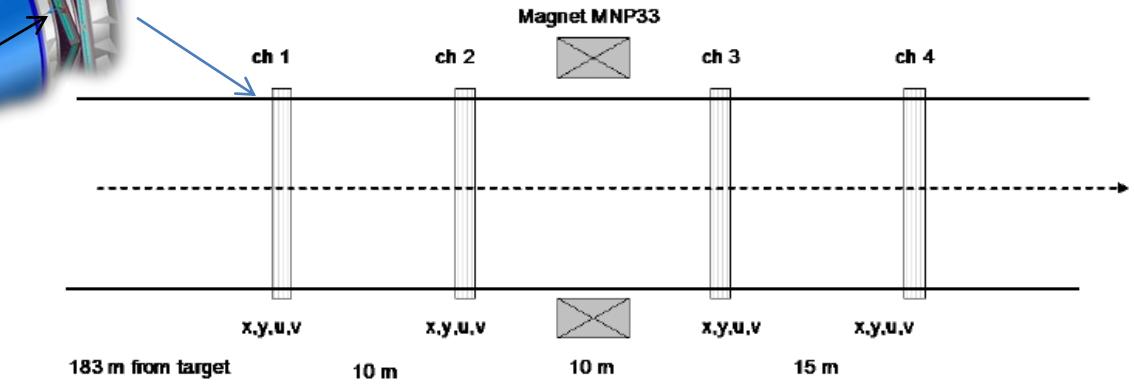

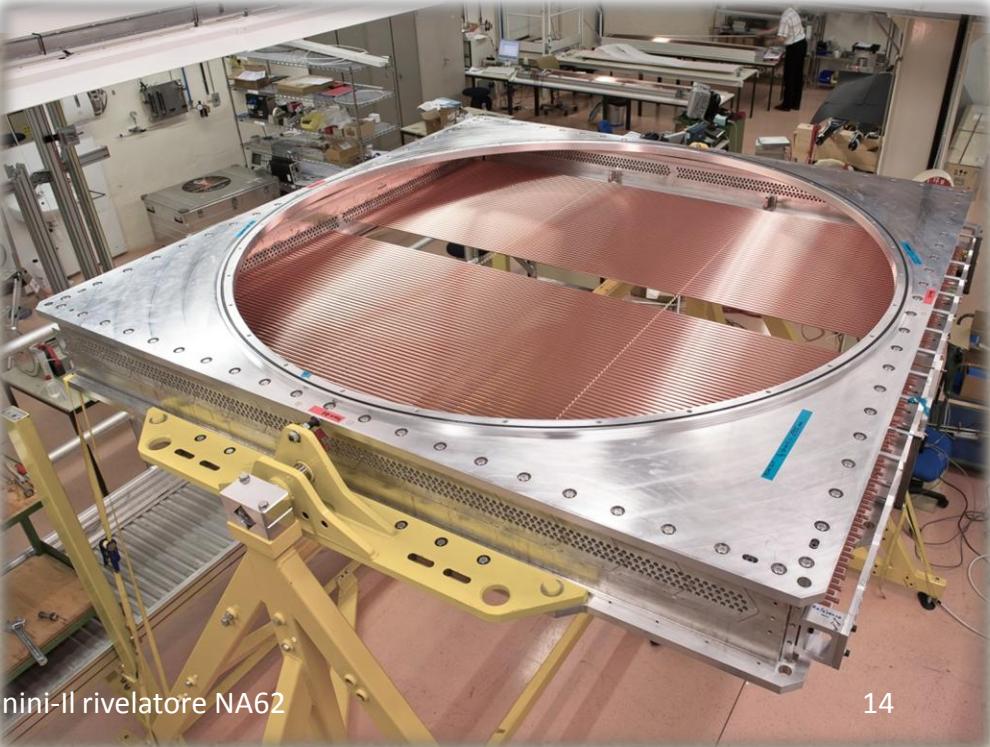

STRAW CHAMBERS

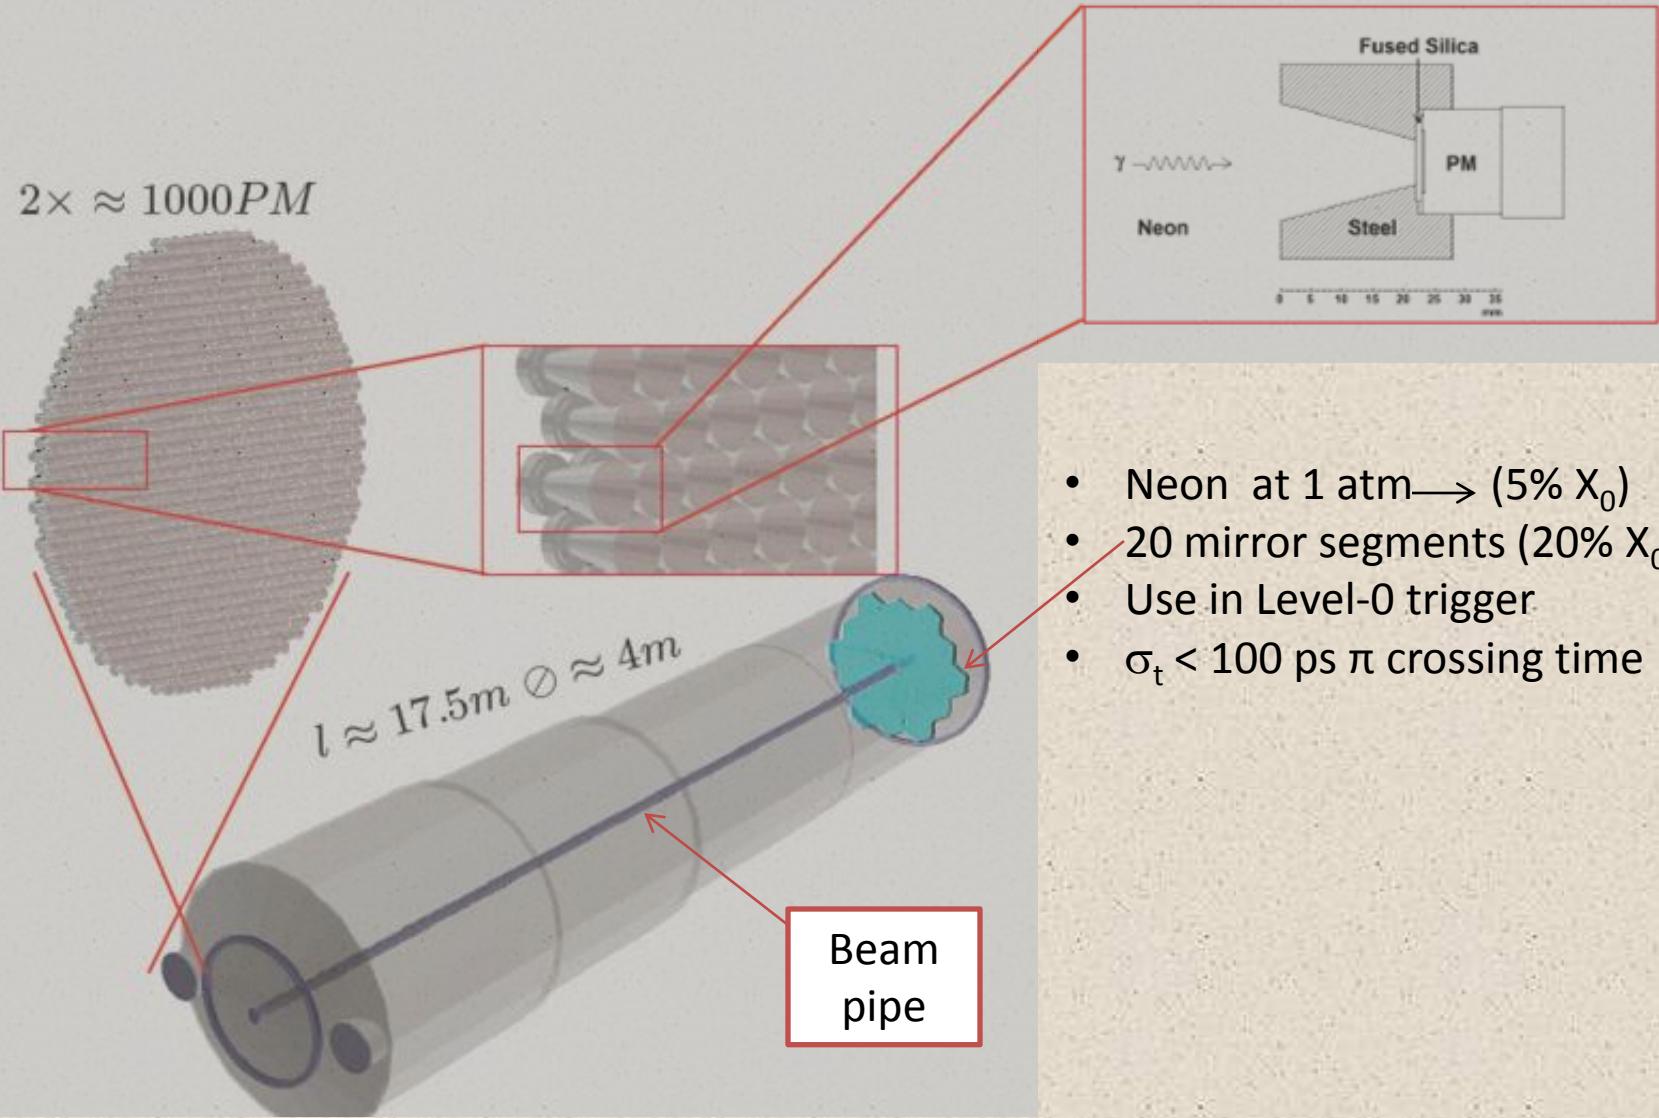

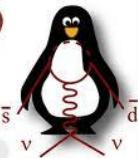

$B=0.36\text{ T}$

- 4 straw drift chambers
- 4 views/chamber (u-v, x-y)
- 2.1 m diameter acceptance
- 12 cm beam hole
- Gas: Ar(70%)/CO₂(30%)
- $\sigma_p/p < 1\%$
- $\sigma_\theta < 60 \mu\text{rad}$
- $\sigma_{\text{coord}} < 130 \mu\text{m}$
- Material budget < 2% X_0
- > 99% hit efficiency
- Operate in vacuum (first time!)
- Max counting 0.5 MHz

Lorenzo Pagnanini-II rivelatore NA62

PHOTON VETOES

I fotoni provengono prevalentemente dal decadimento del π^0 , si distinguono tre casi:

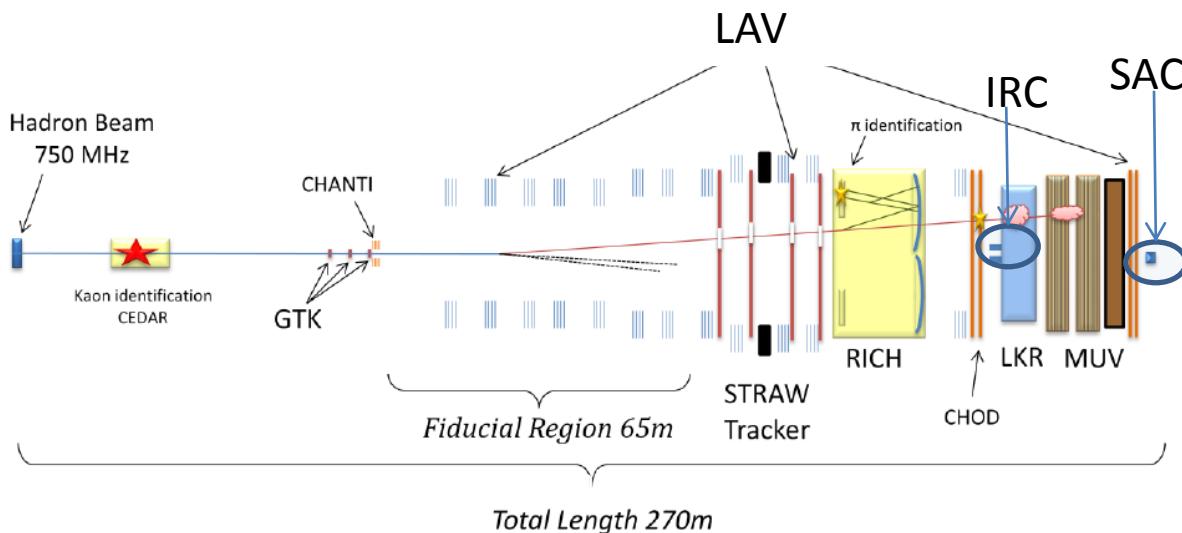

- Entrambi i fotoni in avanti nel calorimetro con un'energia totale di circa 40 GeV;
- Un fotone in avanti nel calorimetro, l'altro nel LAV;
- Un fotone in avanti nel calorimetro e l'altro ad angoli maggiori di 50 mrad.

LAV (Large Angle Veto) 50-8.5 mrad

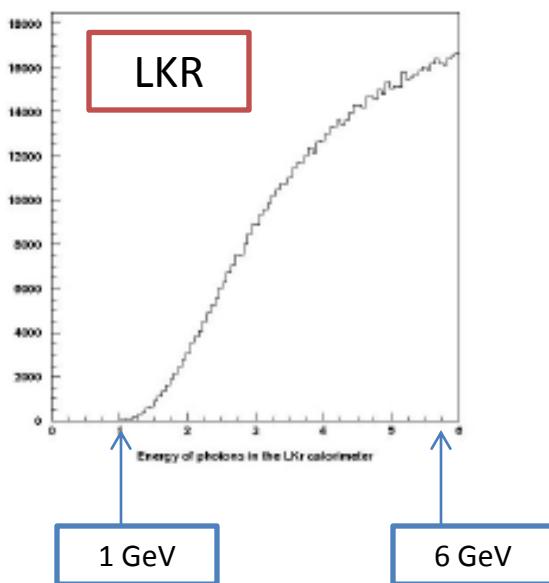

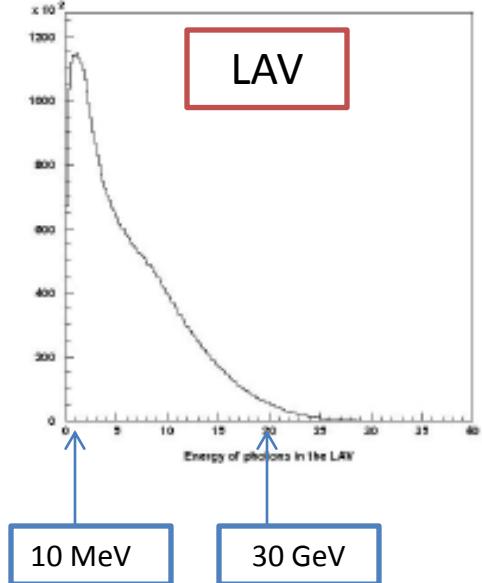

LKR (Liquid KRyton calorimeter) 8.5-1 mrad

SAV (Small Angle Veto) <1 mrad

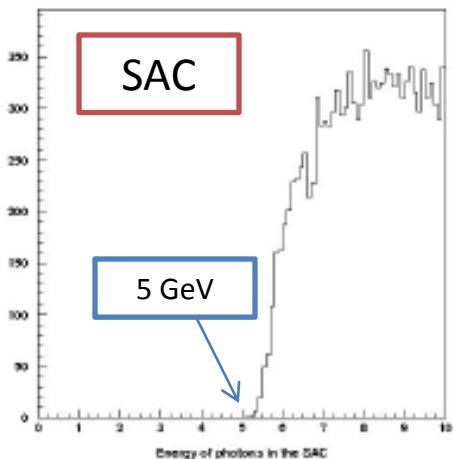

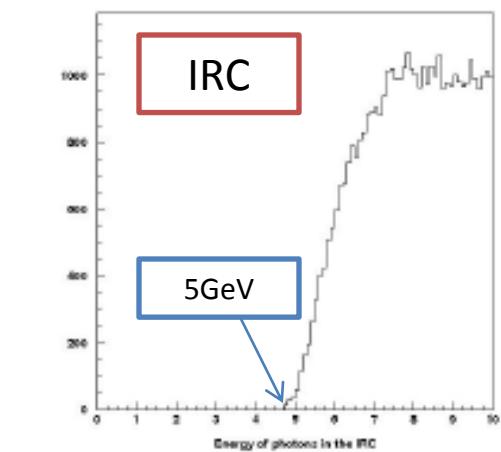

SAC (Small Angle Calorimeter)
IRC (Intermediate Ring Calorimeter)

PHOTON VETOES

GRANDE ANGOLO
“BASSA” ENERGIA

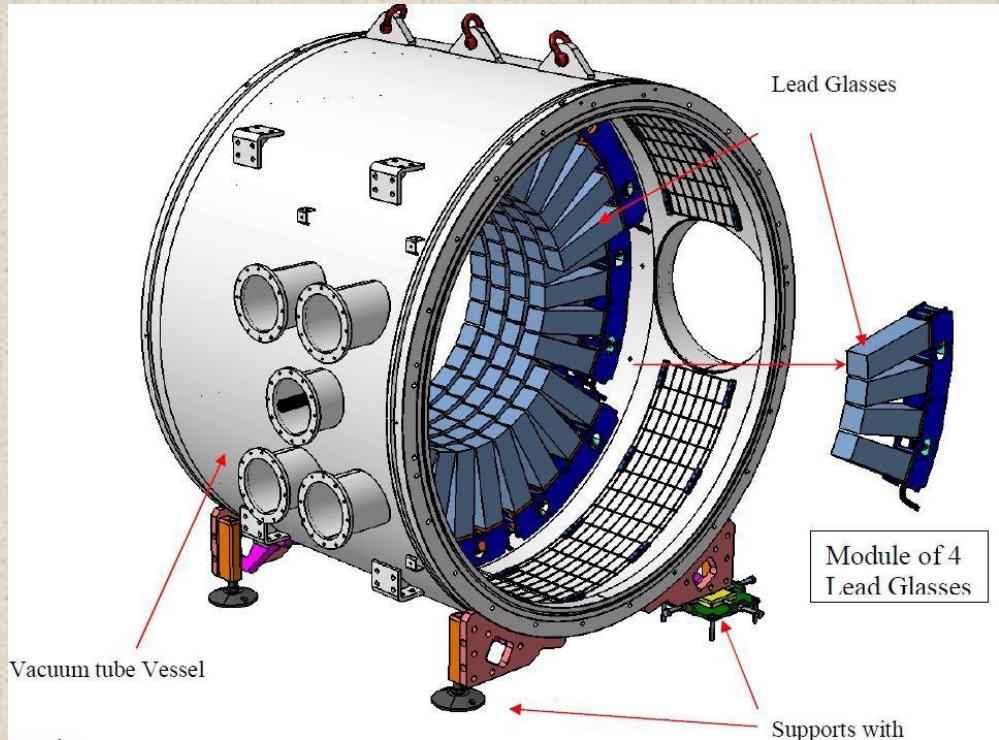

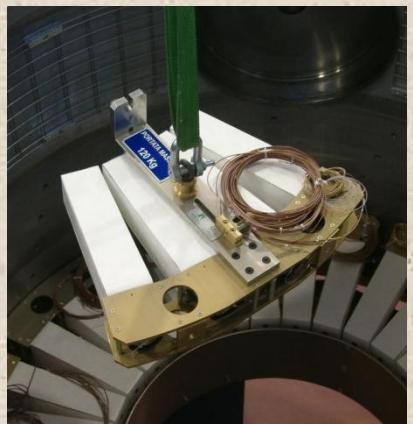

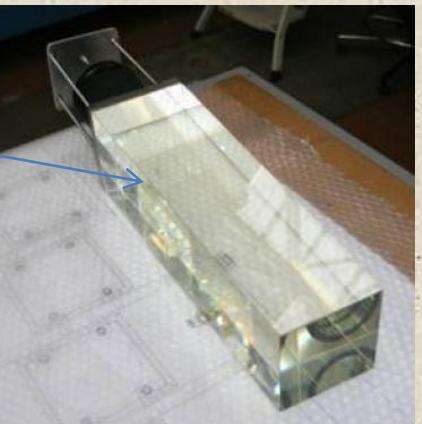

BASSO ANGOLO
ALTA ENERGIA

Large Angle Veto

- **12 stations** along the decay tube
- (11 in vacuum+ 1 following RICH)
- 2500 lead glass crystals with attached photomultipliers (**OPAL e-cal**)
- Cover 8.5 to 50 mrad
- $\sigma_E \approx 9\%/\sqrt{E}$
- $\sigma_t \approx 210 \text{ ps}/\sqrt{E}$

Liquid Krypton Calorimeter

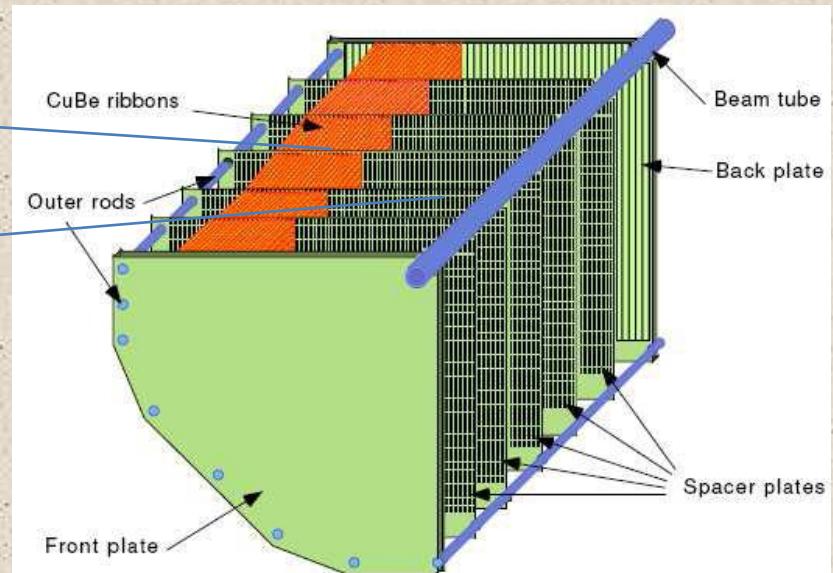

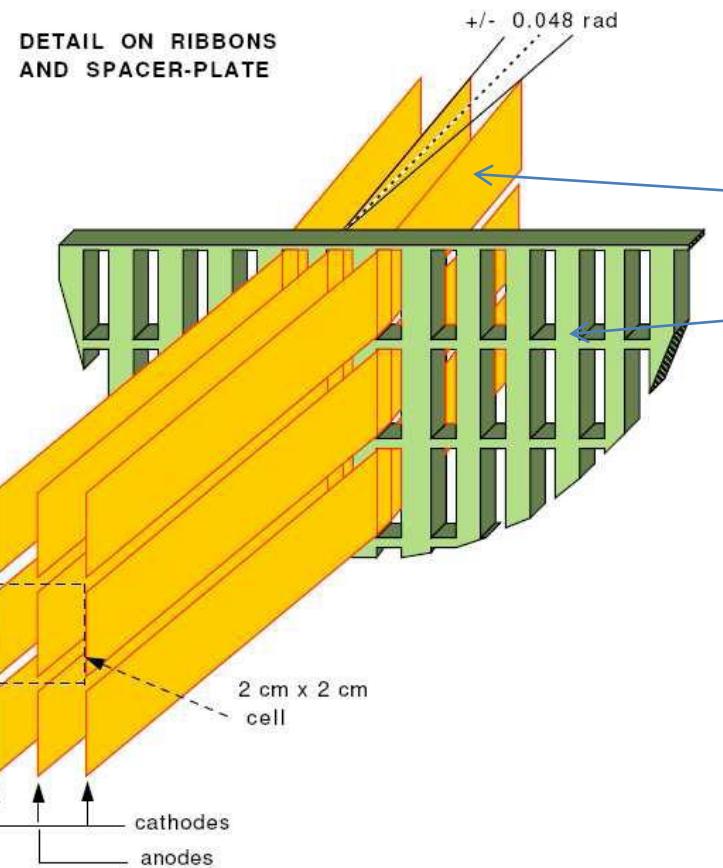

Quasi-homogeneous ionization chamber:

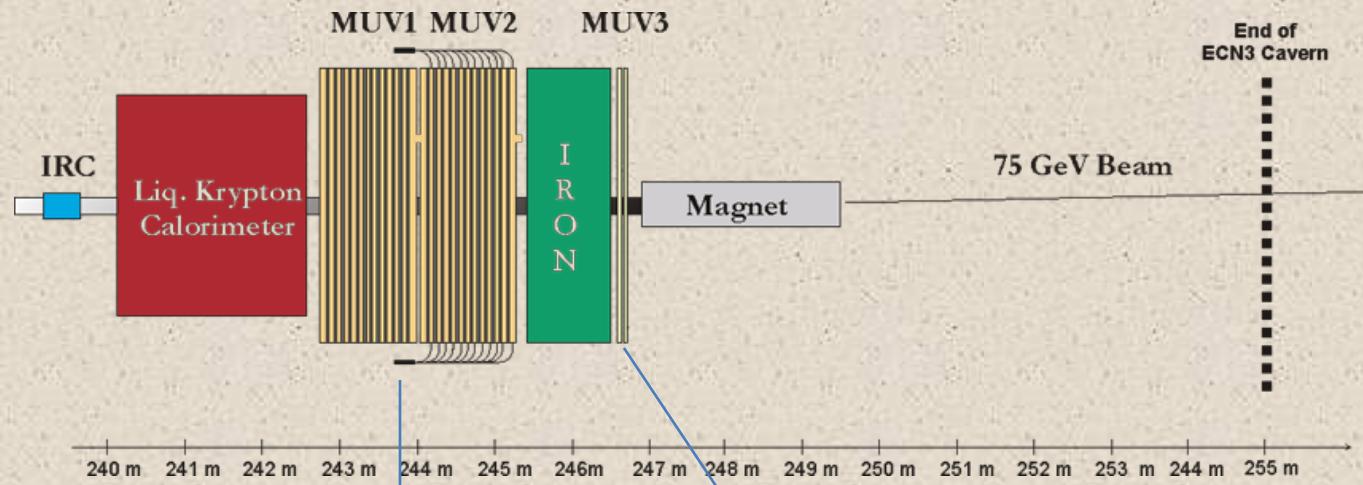

- Almost fully active calorimeter (9m^3 , very good resolution)
- Cold noble liquid (very good stability)
- Cover 8.5 to 1 mrad
- Length 127 cm $\sim 27X_0$
- Time resolution: 500 ps (photon)
- Position resolution: better than 1% above 20 GeV
- Energy resolution: 1% above 20 GeV
- Non linearity: < 0.2 % in 5-100 GeV energy range
- Electrons rejection measuring E/p ratio

$$\frac{\sigma(E)}{E} \approx \frac{(3.2 \pm 0.2)\%}{\sqrt{E}} \oplus \frac{(10 \pm 1)\%}{E} \oplus (0.42 \pm 0.05)\%$$

Liquid Krypton Calorimeter

MUON VETOES

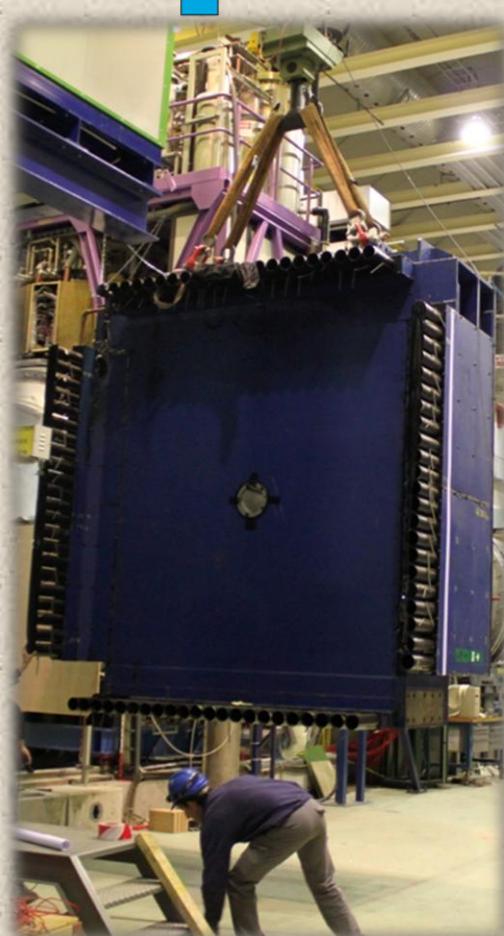

Work as hadronic calorimeter:
Shower shapes of incident particle

Fast signal for L0 Trigger:

- time resolution 1 ns
- coincident signal with GTK e CEDAR

Separation electromagnetic muon showers from hadronic pion showers.

MUON VETOES

2 classic iron-scintillator sandwich calorimeter:

- **MUV1:**
 - 25 layer of scintillator strips
 - **Transversal segmentation**
- **MUV2:**
 - Recycled from HAC of NA48
 - 22 layer of scintillator strips

Scintillator strips
alternatively oriented in the
horizontal and vertical
directions

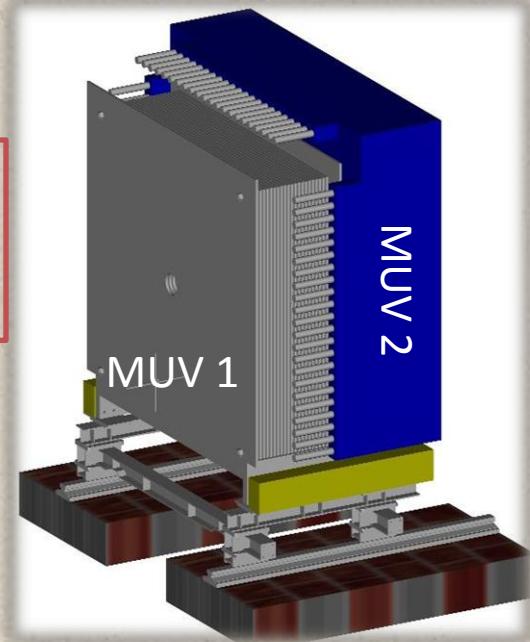

MUV3:

- After 80 cm iron wall
- Scintillator pads with direct readout of light in an black box
(to suppress reflections and Cerenkov)
- **Fast trigger signals**
- **Detecting non-showering muons**

TRIGGER

Richieste primarie:

- 1)Una sola traccia nel CHOD
- 2)Assenza di segnale nel MUV 3
- 3)Non più di un cluster nel calorimetro LKR

Selezione eventi

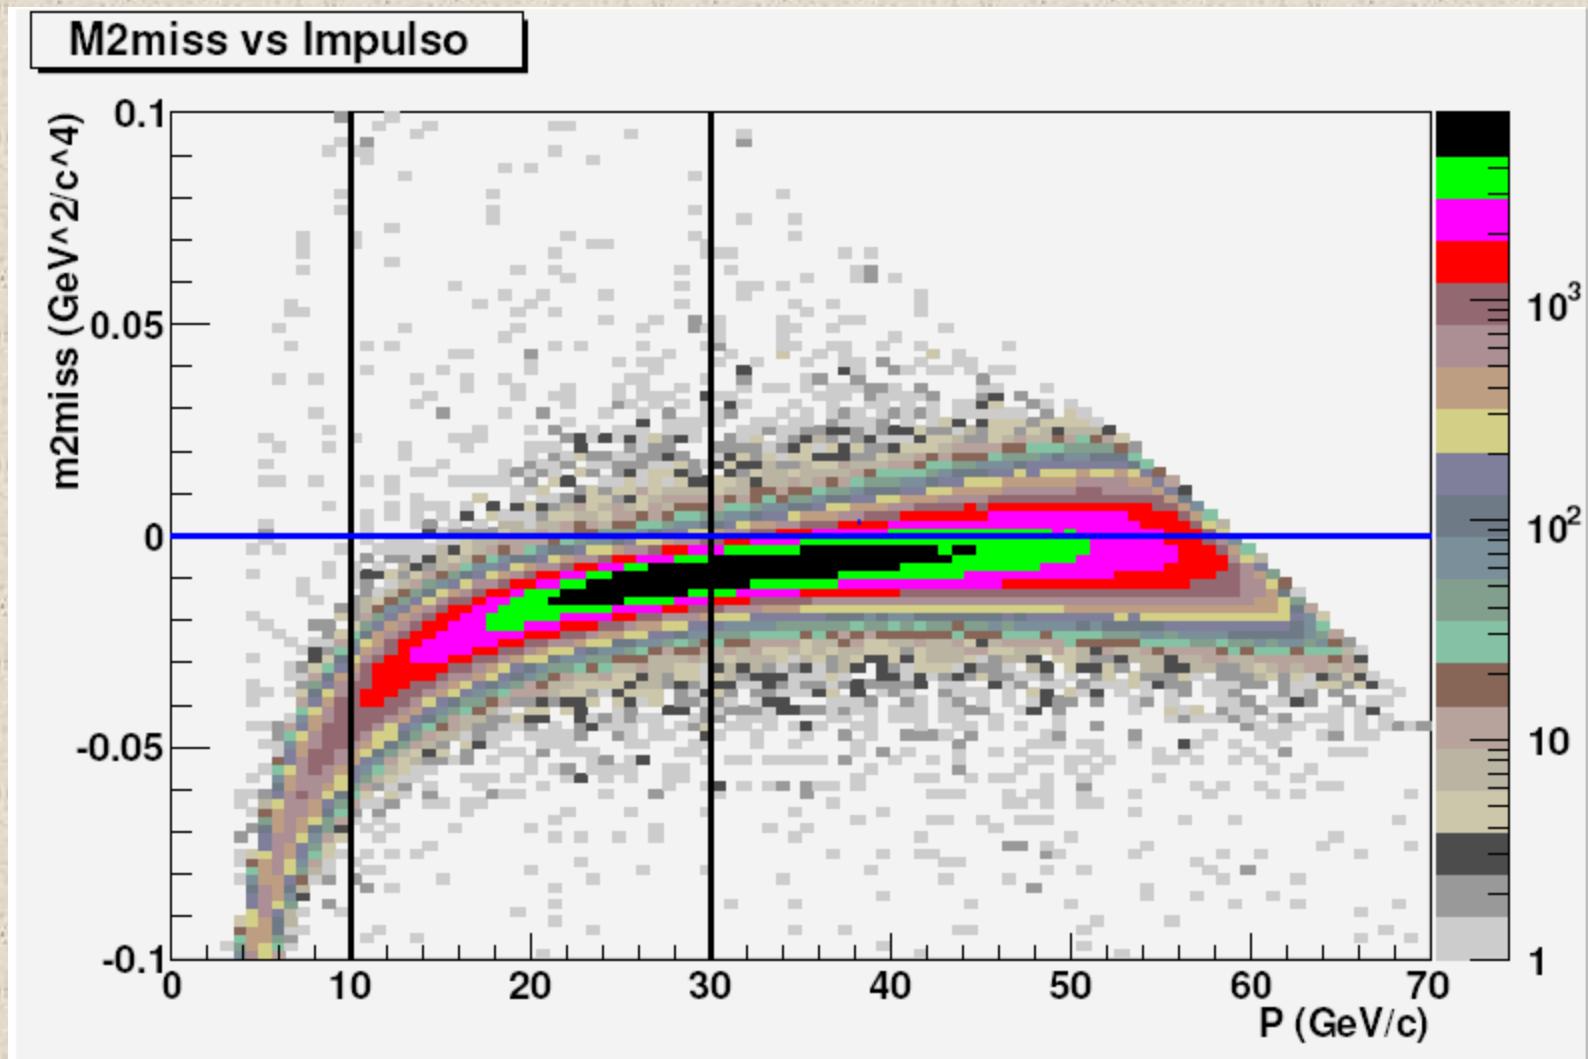

Per eliminare il fondo di muoni:

- si richiede che non vi sia un segnale nel rivelatore per muoni; $\overline{\text{MUV}}$
- si richiede un valore minimo per l'energia del cluster associato alla traccia: $E_{cl} > 2 \text{ GeV}$; tale valore è stato scelto perché nel caso in cui un muone generi un cluster nel calorimetro, questo non può avere energia maggiore di 1 GeV, data la dimensione longitudinale del calorimetro.
- si richiede un intervallo di valori per l'impulso della traccia carica: $10 < P_{traccia} < 30 \text{ GeV}/c$; tale taglio ha lo scopo principale di eliminare eventi del tipo $K^\pm \rightarrow \mu^\pm \nu$, l'intervallo scelto è stato determinato in maniera grafica dalla distribuzione della massa mancante,

- Regione 1: $(0 < m_{miss}^2 < 0.009) \text{GeV}^2/c^4$
- Regione 2: $(0.028 < m_{miss}^2 < 0.068) \text{GeV}^2/c^4$

Taglio su P_{track}

Selezione eventi

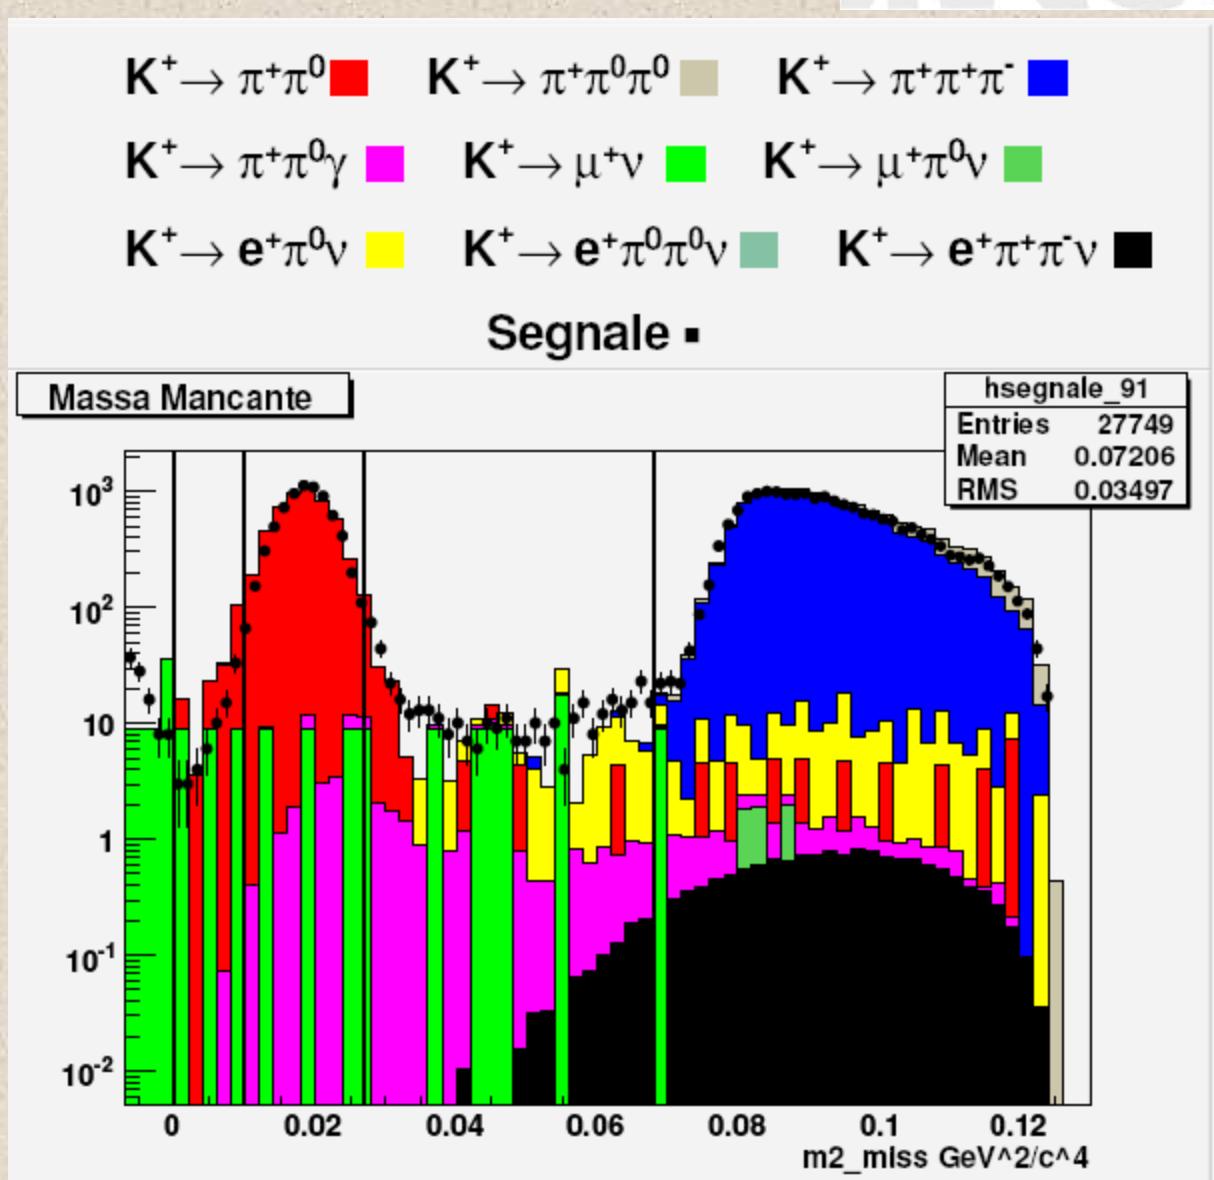

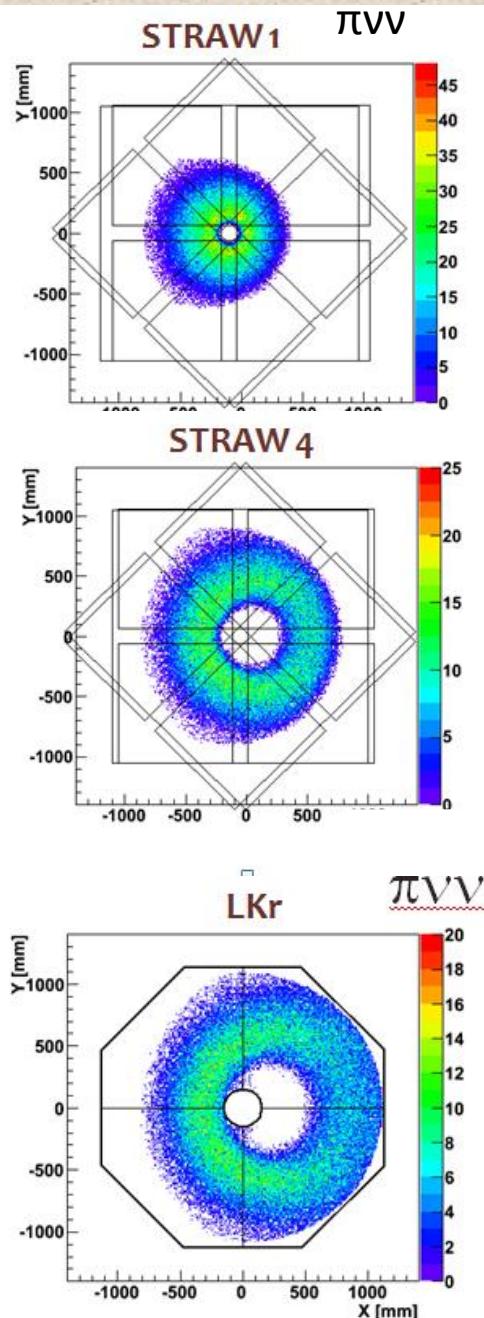

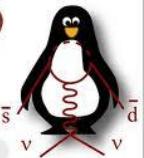

Per eliminare gli elettroni vengono applicati i seguenti tagli:

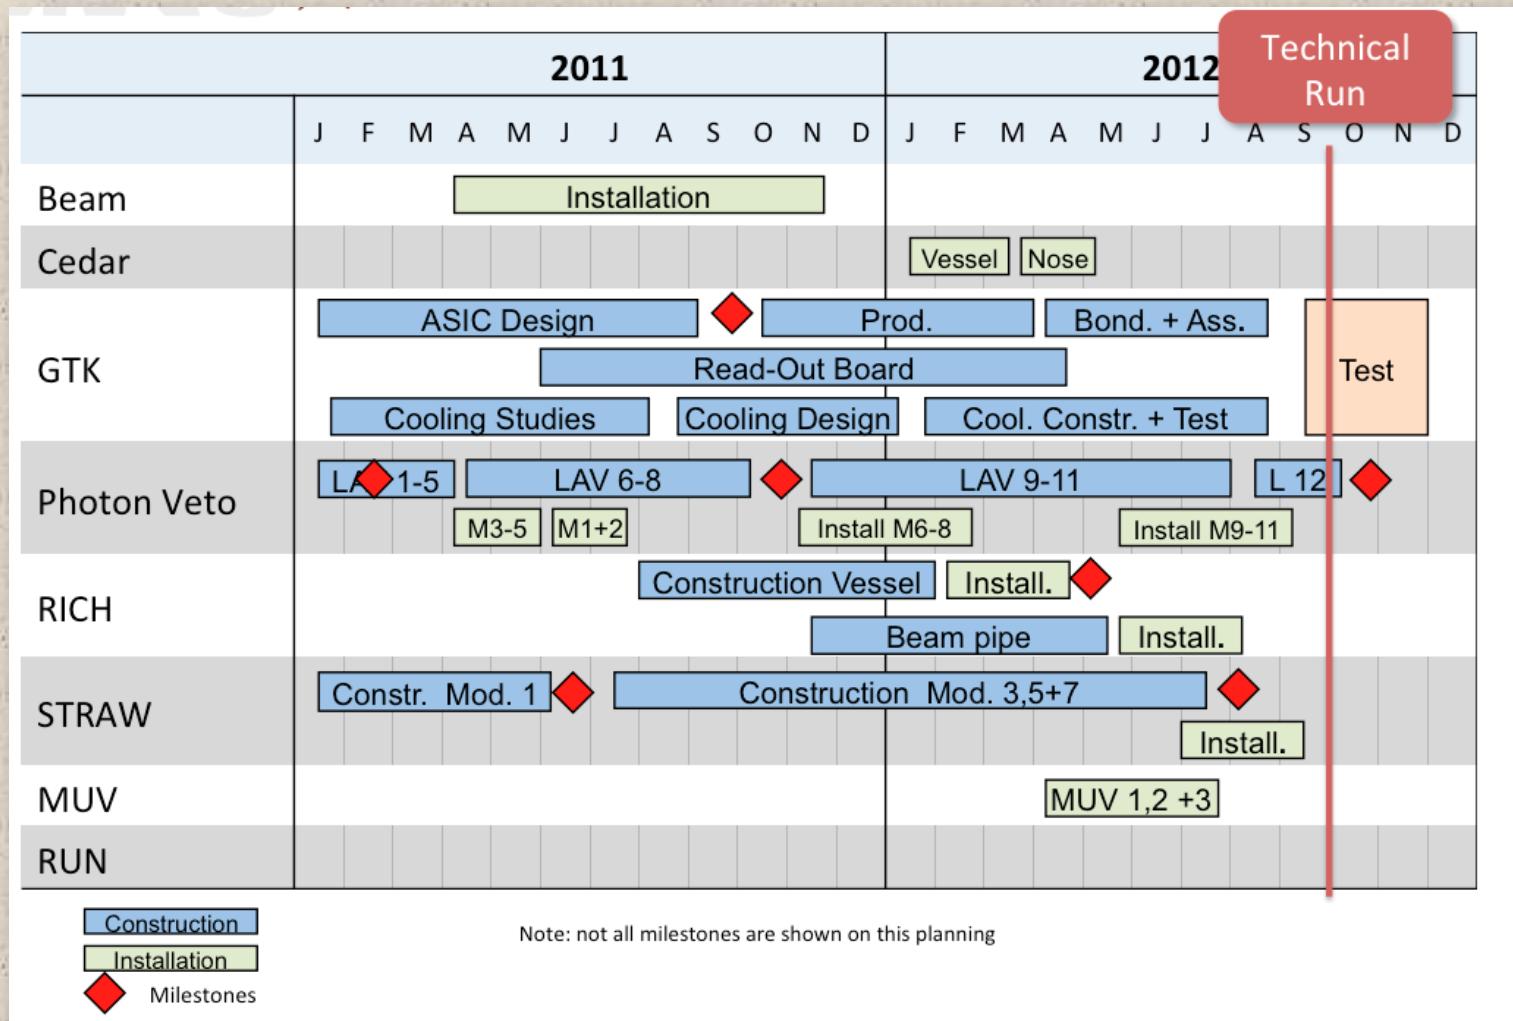

- si richiede $E/p < 0.8$ dove E è l'energia della traccia carica, ricostruita con il calorimetro elettromagnetico, e p è l'impulso di tale traccia ricostruito con lo spettrometro; 0.8 è un valore standard, la distribuzione di tale rapporto è mostrata in figura 3.3(a).
- si richiede $l_{cluster} > 1.15$ celle, dove $l_{cluster}$ rappresenta la larghezza del cluster; è stato scelto questo valore perché, a causa delle dimensioni delle celle del calorimetro, i cluster elettromagnetici, che devono essere eliminati, sono contenuti in una sola cella.

CARATTERISTICHE DEL FASCIO

Fascio di K^+ a 75 GeV/c prodotti simultaneamente da un fascio di protoni a 400 GeV/c proveniente dall'acceleratore SPS del CERN. L'estrazione avviene ogni 16.8 se in pacchetti di durata 4.8 s con un'intensità di circa 7×10^{11} .

BERSAGLIO:

Cilindro di Berillio $r=0.2\text{ cm}$ $h=40\text{ cm}$ $\sim 1 X_0$ per protoni
